

# Actuarial Committee

## Meeting Agenda

Date	Time	Location	Staff Contact
December 8, 2020	9:30 AM	WCIRB California 1221 Broadway, Suite 900 Oakland, CA	David M. Bellusci
1221 Broadway, Suite 900 • Oakland, CA 94612 • 415.777.0777 • Fax 415.778.7007 • www.wcirb.com • wcirb@wcirb.com			

Released: December 1, 2020

**Due to the coronavirus (COVID-19) pandemic, this meeting is being held via webinar teleconference.**

Please register for the meeting at:

<https://attendee.gotowebinar.com/register/2199581119280713232>

After registering, you will receive a confirmation email containing information about joining the webinar.

### I. Approval of Minutes

Meetings held on August 4, 2020, August 10, 2020, and September 8, 2020

### II. Working Group Meeting Summaries

Actuarial Research Working Group Meeting held October 6, 2020

### III. Unfinished Business

- A. AC02-03-03: Experience of Large Deductible Policies
- B. AC16-06-05: Update on Medical Severity Trends by Component
- C. AC17-12-02: Legislative Cost Monitoring
- D. AC19-12-02: Review of ULAE Projection Methods
- E. AC20-04-04: COVID-19 Crisis

### IV. New Business

- A. AC20-12-01: 9/30/2020 Experience Review
- B. AC20-12-02: Review of Projections Based on 9 Months
- C. AC20-12-03: Classification Ratemaking – Loss Development

#### Antitrust Notice

As members of the Workers' Compensation Insurance Rating Bureau of California, you are bound, when involved in meetings or other activities of the WCIRB California, to limit your actions (and discussions other than social ones) to matters relating to the business of the WCIRB California. Matters that do not relate directly to WCIRB California business should be avoided. Members should particularly avoid discussions or conduct that could be construed as intended to affect competition (or access to markets). Thus, as members, you should not discuss or pursue the business interests of individual insurers or others, including, in particular, the plans of individual members involving, or the possibility or desirability of (a) raising, lowering, or stabilizing prices (premiums or commissions); (b) doing business or refusing to do business with particular, or classes of, insurers, reinsurers, agents, brokers, or insureds, or in particular locales; or (c) potential actions that would affect the availability of products or service either generally or in specific markets or locales.

- D. AC20-12-04: Experience Rating Eligibility
- E. AC20-12-05: Special Data Call for COVID-19 Claims
- F. AC20-12-06: Potential Applications of Indemnity Transaction Data
- G. AC20-12-07: Potential 2021 Actuarial and Research Projects
- H. AC20-12-08: Potential Changes to Collection of Transaction Data
- I. AC20-12-09: 2021 Schedule of Meetings

**V. Matters Arising at Time of Meeting**

**VI. Next Meeting Date:** February 16, 2021 (tentative)

**VII. Adjournment**

**Notice**

The information in this Agenda was developed by the Workers' Compensation Insurance Rating Bureau of California (WCIRB) for the purpose of assisting the WCIRB Actuarial Committee. The WCIRB cannot make any guarantees if this information is used for any other purpose and the WCIRB shall not be liable for any damages, of any kind, whether direct, indirect, incidental, punitive or consequential, arising from the use of or reliance upon this information for any other purpose.

**RE: Summary of October 6, 2020 Meeting**

## **Insurer Meeting Participants Were Reminded of the Antitrust Notice**

As members of the Workers' Compensation Insurance Rating Bureau of California, you are bound, when involved in meetings or other activities of the WCIRB California, to limit your actions (and discussions other than social ones) to matters relating to the business of the WCIRB California. Matters that do not relate directly to WCIRB California business should be avoided. Members should particularly avoid discussions or conduct that could be construed as intended to affect competition (or access to markets). Thus, as members, you should not discuss or pursue the business interests of individual insurers or others, including, in particular, the plans of individual members involving, or the possibility or desirability of (a) raising, lowering, or stabilizing prices (premiums or commissions); (b) doing business or refusing to do business with particular, or classes of, insurers, reinsurers, agents, brokers, or insureds, or in particular locales; or (c) potential actions that would affect the availability of products or service either generally or in specific markets or locales.

## **Discussion Topics**

At the meeting, the following topics were discussed.

### **A. Experience Rating Eligibility**

The Working Group was informed that the WCIRB has investigated the predictive power of loss experience for employers who are currently not experience rated. Lowering the eligibility threshold would help to incentivize safety for smaller employers.

Staff developed optimal primary thresholds for employers with expected loss sizes below the current threshold using the same methodology that was used to compute the optimized thresholds used in the Experience Rating Plan and calculated the indicated experience modifications using these thresholds. Staff shared exhibits showing that while most of these small employers were claim-free during the experience period, the employers who incurred claims in the experience period were significantly more likely to incur claims in the projection period. Staff also shared quintile tests showing that loss ratios in the experience period were predictive of loss ratios in the projection period for risks significantly below the current eligibility threshold and that the variance ratio was typically below 60%.

Staff presented research showing that experience modifications optimized for and calculated with five years of experience did not outperform experience modifications based on three years of

## Meeting Summary

Date: November 24, 2020

experience. Given these results and many of concerns with extending the length of the experience period, staff did not recommend extending the experience period to five years.

Staff observed that, because optimal primary thresholds increase more slowly than the expected loss associated with a particular threshold, larger risks effectively have a lower cap for the impact of a single claim on their experience modification. Staff presented an option to cap experience modifications based on the number of claims incurred in the experience period. This would ensure that the impact of a single claim for risks currently below the eligibility threshold does not exceed that for risks currently just above the eligibility threshold. This would help reduce the volatility of year over year changes in experience modifications for smaller risks while decreasing the efficiency of the overall plan only slightly.

Several Working Group members expressed support of the count-based caps as a basis to reduce potential experience rating plan volatility for very small employers. One member asked how the caps would be updated. Another member suggested considering the impact of defining the caps per occurrence rather than per claim. Some members expressed concerns about the potential impact of significantly lowering the experience rating eligibility threshold on contractors. Staff agreed to review this impact by industry sector and would discuss these impacts in future outreach efforts.

One member suggested that the impact of a single claim should be lower than in the proposal shown since, while more employers who have claims during the experience period are more likely to have claims in the projection period, there are also a significant number who do not have any claims in the projection period. Another member suggested that any proposal should rely on the actuarially indicated modifications as they enhance the efficiency of the plan.

The Working Group was advised that staff will present an update to the Actuarial Committee to solicit additional feedback regarding a potential change in the Experience Rating Plan experience rating eligibility.

### **B. Classification Ratemaking Loss Development**

The Working Group was reminded that the WCIRB has begun a multi-year review of the classification ratemaking process and that loss development was the first component being studied. The Working Group was reminded that at the March 3, 2020 meeting, it was agreed that this study would focus on limited loss development rather than unlimited loss development.

Staff presented the current methodology for dividing classifications into loss development groups (LDGs), which is based on an iterative bifurcation of classifications using a Kruskal-Wallis test to determine the optimal division of classifications.

The Working Group was shown several alternative development groupings under consideration. Four of these options were based primarily on classification, while the final option used part of body, claim status, injury type and cumulative trauma indicators to determine groups. The first two classification-based alternatives found groups using a Kruskal-Wallis bifurcation, as in the past. However, updated versions determined LDGs using development on open claims only. The first alternative would develop all claims in a LDG together, while the second alternative would develop open claims using the newly found LDGs and develop all closed claims as a single

## Meeting Summary

Date: November 24, 2020

group. The third and fourth alternatives were analogous to the first and second, but used a decision tree in lieu of the Kruskal-Wallis bifurcation to determine optimal LDGs. The decision trees are a supervised machine learning method that used development on individual claims, as opposed to aggregate development, to determine optimal groups. The Gini index is used to measure the homogeneity of possible groups. The final alternative used a decision tree along with the previously mentioned claim characteristics to determine development groups.

Staff presented the results for each alternative and noted that staff judged alternatives by their accuracy, the level of distinction between groups, simplicity of implementation and explanation, and by the consistency of development patterns across maturities. A Working Group member noted, and staff agreed, that inconsistency at later maturities would be acceptable if differences at earlier maturities were large enough.

Staff noted that the classification groupings using the Kruskal-Wallis bifurcation and the decision tree methods were very similar. This added confidence to the results of both methods, given that determinations were made using aggregate development in one case and individual claim development in the other, along with differences in the optimization decision.

While reviewing the performance of the alternatives, staff noted that, on an observation-weighted basis, the decision tree alternative using claim characteristics consistently outperformed the other methods. Staff attributed this to the method's ability to successfully determine characteristics that predict development.

Ultimately, staff recommended developing claims using LDGs determined using a Kruskal-Wallis bifurcation for open claims along with separate development of closed claims. Staff noted that for any method using claim characteristics that can change between maturities, particularly claim status, separate development factor triangles would be needed for claims known open at report level 1, known open at report level 2, and so on. The Working Group did not see this as a significant concern, but requested that these triangles be available in an electronic format.

The Working Group was advised that staff will present an update to the Actuarial Committee to solicit additional feedback regarding loss development methodologies for classification ratemaking.

## **Item AC02-03-03**

### **Experience of Large Deductible Policies**

Beginning with the year 2000 evaluation, the WCIRB has issued annual data calls for calendar year premium and pure premium data and December 31 evaluations of accident year loss, allocated loss adjustment expense, and claim count experience for large deductible policies.<sup>1</sup> Annually, the Committee reviews the summarized large deductible experience. In these annual reviews, the Committee generally found (a) the percentage of business written on a large deductible basis had been relatively stable, (b) claim reporting and development patterns for experience written on a large deductible basis were generally similar to those of non-large deductible policies and (c) the impact of excluding the large deductible experience from the rate level calculation has been relatively modest. As a result, the Committee has generally agreed that no adjustment to statewide experience to address large deductible policies is necessary. The Committee also agreed that annual reviews of updated large deductible experience should continue and the results monitored and presented to the Committee.

Included as Exhibits 1 through 7 is the summary of December 31, 2019 large deductible experience. For comparison purposes, Exhibits 1 through 7 also include analogous information summarizing the non-large deductible experience of insurers writing a large volume of large deductible experience, the experience of all non-large deductible policies, and the total statewide experience.

---

<sup>1</sup> A large deductible policy is defined as having a deductible amount per claim or accident of at least \$100,000.

### **Update on Medical Severity Trends by Component**

Twice a year, the Committee reviews a summary of changes in paid per transaction and paid transactions per claim by medical component. An update to that analysis with medical transaction data through June 30, 2020 will be presented at the meeting. The update also includes a comparison of the severity trends before and after the COVID-19 pandemic started. Slides outlining the updated medical severity trends are attached.

### **Legislative Cost Monitoring**

At the August 1, 2019 meeting, the Committee reviewed updated cost monitoring information related to the Medical Treatment Utilization Schedule (MTUS) Drug Formulary adopted pursuant to Assembly Bill No. 1124 effective January 1, 2018. At that meeting, it was observed that consistent with the expectations of the new formulary impact, the prescriptions of exempt drugs increased while the prescriptions of non-exempt drugs decreased in 2018 compared to the pre-reform level. In addition, the decline in the shares of pharmaceutical payments to opioids, compounds, physician-dispensed and brand name drugs accelerated in 2018 compared to prior years. The Committee was advised that the review of the MTUS Drug Formulary was based on one year of post-reform data and the WCIRB staff will update the review once another full year of post-reform data is available.

At the meeting, staff will present an update to the cost impact analysis of the MTUS Drug Formulary, using medical transaction data through March 14, 2020, the pre-pandemic period.

## **Item AC19-12-02**

### **Review of ULAE Projection Methods**

Over the last several years, the WCIRB has made a number of changes to the data collection process for ULAE to more accurately compile the ULAE data appropriate for pure premium ratemaking. Although the Committee reviews the ULAE projection each year in preparation of the annual pure premium rate filing, in part due to this transition of the data collection process, a comprehensive review of the ULAE projection methodology had not been undertaken for several years. Since the ULAE data reviewed over the last few years reflects a generally consistent process, in 2019 staff conducted an initial analysis of ULAE projection methodologies for potential enhancements. At the December 5, 2019 meeting, the Committee reviewed the analysis and recommended follow-up analysis in several areas for 2020. Staff's follow-up analysis and recommendations are summarized below.

#### *Overview of Methods*

The WCIRB primarily utilizes two methods to project ULAE. The first method is based on the relationship between paid ULAE and open indemnity claim counts (open count method). This approach assumes calendar year ULAE is a function of the number of open indemnity claims at the beginning of the calendar year. The number of open indemnity claims is projected for the next three calendar years based on (a) projected claim frequency changes and (b) estimated claim development and claim settlement rate patterns. The average ULAE paid per open indemnity claim in future years is projected based on historical ULAE paid per open indemnity claim amounts and changes in statewide average wage levels. The average ULAE per open indemnity claim and number of open indemnity claims projected for each of the next three calendar years are multiplied together to compute the total projected ULAE. The projected ULAE for the upcoming policy year is based on the average of the most recent two calendar years. This is further adjusted to the estimated average payment date of claims occurring in the upcoming policy year using projected wage level changes to adjust the projected average paid ULAE amounts.

The second method is based on the relationship between ULAE and paid losses (paid loss method). This approach assumes larger claims incur more claims handling costs than smaller claims and, as a result, ULAE is more highly correlated with paid loss amounts than open claim counts. This approach projects calendar year paid loss to premium ratios for the next three calendar years based on (a) the latest year paid development pattern and (b) projected accident year loss ratios, premium on-level factors, and loss on-level factors from the loss projection methodology. The projected calendar year ULAE to loss ratios are based on the average of the most recent two calendar years (with no trend applied). The projected calendar year ULAE to loss ratios are multiplied by the projected calendar year loss to premium ratios to compute the projected calendar year ULAE to premium ratios. The projected ULAE for the upcoming policy year is based on the average of the most recent two calendar years.

In the last several pure premium rate filings, the WCIRB has based the projected ULAE to loss ratio on the average of the ratios produced by the open count method and the paid loss method. In addition, the WCIRB has excluded the ULAE experience of the State Compensation Insurance Fund in the average ULAE amounts used in these approaches but the claim frequency and loss ratio projections are on a statewide basis.

#### *Review of Open Count Method*

At the December 5, 2019 meeting, the Committee reviewed retrospective comparisons of the primary frequency and ULAE severity trend assumptions of the open count method. Exhibit 1 shows the retrospective comparison of the claim frequency projections updated to include calendar year 2019 information. In this approach, future calendar years are projected using the latest available historical calendar years and compared to the actual emergence. Included in Exhibit 1 are alternative methods based on (a) a three-year average selection of claim count development factors and (b) the number of

open indemnity claims in the prior year and the estimated incremental claim closing pattern from the latest year. In all methods, the indemnity claim frequency changes are based on the WCIRB's econometric claim frequency model. On average for the years reviewed, the method based on incremental closing rates is significantly more accurate than the WCIRB's current approach, which is consistent with the results reviewed at the December 5, 2019 meeting. Staff recommends using the incremental closing rate approach in the open count method going forward.

At the August 10, 2020 meeting, a Committee member noted that the claim counts used in the open count method are trended for claim frequency changes but not for growth in exposure levels. Staff reviewed the trending assumptions to ensure the trends are applied consistently. In the open count method, claim counts are trended from the latest available accident year to the projection period. However, the premiums used to derive the projected loss and ULAE amounts that underlie the projected ULAE to loss ratio are based on the latest calendar year and are not trended forward for anticipated changes in exposure. As a result, staff believes using trends based only on claim frequency changes continues to be appropriate.

Exhibits 2.1 and 2.2 show retrospective comparisons of the ULAE severity trend assumptions, which were first reviewed at the December 5, 2019 meeting and updated to include calendar year 2019 information. The ULAE severity projected in Exhibit 2.1 for the WCIRB's current approach is based on statewide average wage level changes forecast by the UCLA Anderson School of Business and California Department of Finance for all industries applied to the latest two calendar years. Also shown in Exhibit 2.1 is an approach based on projecting from the latest calendar year. Exhibit 2.2 shows an alternative wage series based on Classification 8822, *Insurance Companies*, which is projected based on the WCIRB's wage and payroll report for classification ratemaking purposes.<sup>1</sup> None of the alternative ULAE severity trend methods reviewed were significantly more accurate than the WCIRB's current approach. Staff recommends continuing with the current approach, at least until such time that sufficient ULAE data reported under the new data call changes is available to project future ULAE severity trends.

In the open count method, once the paid ULAE severity is trended to the calendar period in which the claims will occur,<sup>2</sup> it is further trended to the estimated average ULAE payment date on these claims. This accounts for the fact that ULAE will be paid on these claims for many years into the future. This trending period is currently estimated based on the average loss payment date from the projected indemnity and medical loss development factors. The projected average indemnity and medical loss payment date as well as the projected ALAE payment date as of March 31, 2020 experience are shown in Table 1. The 25<sup>th</sup> and 75<sup>th</sup> percentiles are also shown for informational purposes. The average payment date for ALAE is only modestly higher than the average for losses.

**Table 1: Number of Years to Reach Specified Percentiles of Payments**  
**Data as of March 31, 2020**

Component	25 <sup>th</sup> Percentile	50 <sup>th</sup> Percentile	75 <sup>th</sup> Percentile
Indemnity	1.6	2.7	5.4
Medical	1.4	3.0	9.1
Total Losses	1.5	2.9	7.5
ALAE	1.7	3.1	8.0

Staff reviewed other potential bases to compare the average date of ULAE payment such as claim settlement rates and incurred loss development. Staff did not believe claim settlement rates to be an appropriate basis given that smaller claims tend to be settled quicker, and larger claims that are open later tend to incur more ULAE. For incurred loss development, given that incurred development can be

<sup>1</sup> This series is based on mapping American Community Survey wages by occupation to WCIRB classifications and projected using a time series model.

<sup>2</sup> For example, calendar years 2021 and 2022 for policies incepting in 2021.

negative at later periods and that these reserve takedowns likely incur ULAE, it may not be an appropriate basis for this measure either. Based on this review, staff did not find a significant rationale for deviating from the current approach in estimating the average duration of ULAE payments based on paid loss development.

#### *Review of Paid Loss Method*

Exhibit 3.1 and 3.2 show retrospective comparisons of calendar year paid loss ratios projected in the paid loss method, which were first reviewed at the December 5, 2019 meeting and updated to include calendar year 2019 information. Exhibit 3.1 shows the retrospective comparison of paid indemnity and medical loss ratios for the WCIRB's current approach which is based on applying the latest year unadjusted paid loss development factors to project the next calendar years' ratios. The differences from the actual loss ratios were significantly higher for the 2010 through 2014 evaluations, which coincided with periods when loss development patterns were changing as a result of Senate Bill No. 863. This may indicate that this approach does not work well during periods of transition. Exhibit 3.2 shows an alternative approach for calendar year medical loss ratios using paid medical loss development factors with an additional adjustment for estimated reform impacts. This alternative approach appears to be somewhat more accurate for medical compared to the current approach. Staff recommends reflecting the adjusted medical development factors in this approach.

Exhibit 4 shows a retrospective comparison of paid ULAE ratios projected in the current paid loss method which is based on the average of the most recent two calendar years. Also shown in Exhibit 4 is an alternative approach based on using the latest year only, which was not significantly more accurate than the current approach. Both approaches tended to be within 1 to 2 percentage points of the actual paid ULAE ratio and not significantly biased low or high. This suggests that there does not appear to be a significant trend in recent paid ULAE to paid loss ratios. As a result, staff recommends continuing to not trend these ratios in the paid loss method.

Although paid ULAE is correlated with paid loss amounts, the current paid loss method requires the projection of calendar year paid loss ratios which includes a number of assumptions. As shown in Exhibits 3.1 and 3.2, projections of calendar year paid loss ratios can be significantly overstated or understated when paid loss development patterns are changing. The projections based on this approach have also tended to be outliers compared to other projections reviewed and recently observed calendar year paid ULAE to paid loss ratios. A significantly simpler paid loss-based approach would be to utilize an average of recent calendar paid ULAE to paid loss ratios, which is also an alternative method reviewed by the Committee and included in pure premium rate filings. Table 2 shows a comparison of projected ULAE-to-loss ratios based on the open count method, current paid loss method, and alternative paid loss-based methods that utilize recent calendar year paid ULAE to paid loss ratios. Also shown in Table 2 are averages of the open count methods with some of the paid loss-based methods.

**Table 2: Projected ULAE to Loss Ratios<sup>3</sup>**

Policy Year	Open Count Method (1)	Current Paid Loss Method (2)	Use Latest Calendar Year (3)	Use Avg. of Latest 2 CYs (4)	Average of (1) and (2)	Average of (1) and (4)
2017	14.6%	11.6%	13.7%	13.4%	13.1%	14.0%
2018	13.1%	10.7%	13.0%	13.4%	11.9%	13.2%
2019	14.9%	12.2%	14.4%	13.7%	13.6%	14.3%
2020	15.6%	13.8%	14.8%	14.6%	14.7%	15.1%
2021	14.1%	13.2%	13.1%	14.0%	13.7%	14.0%
Std Dev	0.0093	0.0124	0.0079	0.0051	0.0101	0.0067

<sup>3</sup> Projections for policy years 2017 and 2018 have been adjusted to reflect the changes to the Expense Call to apportion countrywide paid ULAE using open indemnity claim counts to be comparable to the more recent projections.

As shown by the standard deviations in Table 2, the current paid loss method is the least stable of the alternatives reviewed, while the method based on an average of the latest two calendar years' paid ULAE to paid loss ratios is the most stable. In addition, the current paid loss method is somewhat of an outlier compared to the other methods reviewed. Although staff recommends continuing to average the ULAE projection based on the open count method with a projection based on paid losses, staff believes the latest two calendar years method (a) has been more stable than the current paid loss method during a period with no indication of a significant trend in paid ULAE ratios, (b) simplifies the approach significantly as it does not require additional assumptions to project future calendar year loss ratios, and (c) is a more direct comparison of paid ULAE to paid losses. As a result, staff recommends using this approach in lieu of the current paid loss method.

**Item AC20-04-04**  
**COVID-19 Crisis**

Since the outbreak of the COVID-19 pandemic in early 2020, in addition to discussing the evaluation of the potential cost of current and future COVID-19 claims, at the last several meetings the Committee also reviewed claim information emerging subsequent to the outbreak of the pandemic based on medical and indemnity transaction data. At the meeting, staff will present an update to the preliminary indicators of post-COVID-19 emerging claim experience as well as an update to the impact of the pandemic on medical treatment patterns based on medical and indemnity transaction data updated through November 2020.

## **Item AC20-12-01**

### **9/30/2020 Experience Review**

Staff has prepared an analysis of statewide experience through September 30, 2020, which is included in Exhibits 1 through 8. This information reflects insurers writing approximately 100% of the market based on 2019 premium levels. The methodologies used are consistent with those reflected in the January 1, 2021 Pure Premium Rate Filing. Wage and loss levels were projected to November 1, 2021—the approximate midpoint of experience on policies incepting between January 1, 2021 and August 31, 2021, and premiums were adjusted to the industry average filed pure premium rate level as of July 1, 2020.

As discussed at recent Committee meetings, the COVID-19 pandemic and resulting stay-at-home orders have had a significant impact on the workers' compensation system. In particular, the stay-at-home orders, which began in the middle of March, are expected to significantly distort second quarter and later experience. As a result, paid loss development from this period may not be appropriate to project future payments. At the meeting, staff will discuss the potential impact of the pandemic on loss development emerging in 2020. The projections shown on Exhibits 1 through 8 do not reflect any adjustments for this potential distortion.

For informational purposes, staff has included a projection of the loss ratio for January 1, 2021 and August 31, 2021 policies based on September 30, 2020 experience and the loss development and trending methodologies reflected in the January 1, 2021 Pure Premium Rate Filing with no adjustment for the impact of the pandemic on loss development in the second and third quarter. As shown on Exhibit 8, the projected loss ratio on this basis (prior to the impact of COVID-19 claims) is 0.605. The comparable ratio projected based on March 31, 2020 experience as reflected in the January 1, 2021 Pure Premium Rate Filing (prior to the impact of COVID-19 claims) is 0.618.

Additional supplemental information based on September 30, 2020 experience is included in Exhibits 9 through 14.

- (a) Paid medical loss development factors include the paid cost of medical cost containment programs for accident years 2011 and prior.
- (b) These factors are adjusted for the losses paid prior to July 1, 2017 by -3.6%, -3.8%, -3.4%, -2.4%, -0.9%, and -0.1% to accident years 2011 to 2016, respectively, for the SB 1160 lien reforms. Factors are also adjusted for the impact of pharmaceutical cost reductions to bring the historical payments to the current pharmaceutical cost level.
- (c) Selections are latest year for the 21-to-33 month through 105-to-117 month factors and three-year average for the subsequent age-to-age factors.
- (d) The cumulative factors for 45, 57, 69, and 81 months are adjusted by -3.0%, -1.9%, -1.1%, and -0.2%, respectively, for the impact of the SB 1160 reductions in future lien filings.

(a) Selections are latest year for the 21-to-33 month through 105-to-117 month factors and three-year average for the subsequent paid age-to-age factors.

(b) Based on calculations shown on Exhibits 2.5.3 to 2.5.8. Each of these selections is calculated as the latest year paid indemnity age-to-age factor multiplied by an adjustment for changes in claim settlement rates.

2018	71,679	102,110				
2019	72,943					

F. Average Paid Indemnity per Closed Claim

Accident Year	Evaluated as of (in months)					
	<u>21</u>	<u>33</u>	<u>45</u>	<u>57</u>	<u>69</u>	<u>81</u>
2011						18,127
2012					16,636	18,048
2013				14,918	16,731	17,955
2014			12,965	15,788	17,593	18,801
2015		9,808	13,714	16,382	17,957	
2016	5,368	9,913	13,688	15,979		
2017	5,399	10,083	13,778			
2018	5,796	10,409				
2019	6,015					

- (a) Ratio of closed indemnity claim counts (Item C) to the estimated ultimate indemnity claim counts (Item B) for that accident year.
- (b) The claim counts for the latest evaluation of each accident year are equal to the reported number of closed indemnity claims. All prior evaluations shown are the product of the latest ultimate indemnity claim settlement ratio (Item D) and the ultimate indemnity claim counts (Item B) for that accident year.

2018	740,404	907,556				
2019	780,543					

- (e) Each amount is equal to the product of [the average monthly indemnity payment per open indemnity claim] and [the number of months for the current evaluation]. For evaluations indicating claim settlement rate decreases, the average monthly indemnity payment per open indemnity claim at the prior evaluation is used. For evaluations indicating claim settlement rate increases, the average monthly indemnity payment per open indemnity claim at the same evaluation is used.
- (f) Each amount is equal to [the difference between unadjusted and adjusted closed indemnity claim counts (Items C and E)] multiplied by the corresponding [average paid indemnity per open claim for indemnity claims in transition (Item J)].
- (g) Each amount is the sum of [paid indemnity on open claims (Item I)] and the corresponding [incremental changes in paid indemnity on open claims resulting from the impact of changes in claim settlement rates (Item K)].

Q. Paid Indemnity Loss Development Factors Adjusted for Changes in  
Indemnity Claim Settlement Rates (k)

Accident Year	Evaluated as of (in months)				
	<u>21-33</u>	<u>33-45</u>	<u>45-57</u>	<u>57-69</u>	<u>69-81</u>
2012					1.047
2013				1.067	1.040
2014			1.130	1.068	1.040
2015		1.295	1.125	1.063	
2016	1.756	1.283	1.121		
2017	1.735	1.285			
2018	1.733				
Latest Year	1.733	1.285	1.121	1.063	1.040
3-Year Average	1.741	1.288	1.125	1.066	1.042

- (j) Each factor represents the change in age-to-age development factors from Item O to those in Item N.  
(k) Each factor is the product of [1.0 + the impact of adjustment for changes in claim settlement rates (Item P)] and [the paid indemnity age-to-age development factor from Exhibit 2.5.1].

- (a) Paid medical loss development factors include the paid cost of medical cost containment programs for accident years 2011 and prior.
- (b) These factors are adjusted for the losses paid prior to July 1, 2017 by -3.6%, -3.8%, -3.4%, -2.4%, -0.9%, and -0.1% to accident years 2011 to 2016, respectively, for the SB 1160 lien reforms. Factors are also adjusted for the impact of pharmaceutical cost reductions to bring the historical payments to the current pharmaceutical cost level.
- (c) Selections are latest year for the 21-to-33 month through 105-to-117 month factors and three-year average for the subsequent paid age-to-age factors.
- (d) Based on calculations shown on Exhibits 2.6.3 to 2.6.8. Each of these selections are calculated as the latest year paid medical age-to-age factor multiplied by an adjustment for changes in claim settlement rates.
- (e) The cumulative factors for 45, 57, 69, and 81 months are adjusted by -3.0%, -1.9%, -1.1%, and -0.2%, respectively, for the impact of the SB 1160 reductions in future lien filings.

2018	5,758	10,017				
2019	5,727					

- (a) Ratio of closed indemnity claim counts (Item C) to the estimated ultimate indemnity claim counts (Item B) for that accident year.
- (b) The claim counts for the latest evaluation of each accident year are equal to the reported number of closed indemnity claims. All prior evaluations shown are the product of the latest ultimate indemnity claim settlement ratio (Item D) and the ultimate indemnity claim counts (Item B) for that accident year.

2019	806,686					

- (e) Each amount is equal to the product of [the average monthly medical payment per open indemnity claim] and [the number of months for the current evaluation]. For evaluations indicating claim settlement rate decreases, the average monthly medical payment per open indemnity claim at the prior evaluation is used. For evaluations indicating claim settlement rate increases, the average monthly medical payment per open indemnity claim at the same evaluation is used.
- (f) Each amount is equal to [the difference between unadjusted and adjusted closed indemnity claim counts (Items C and E)] multiplied by [the corresponding average paid medical per open indemnity claim for indemnity claims in transition (Item J)].
- (g) Each amount is the sum of [paid medical on open indemnity claims (Item I)] and the corresponding [incremental changes in paid medical on open indemnity claims resulting from the impact of changes in indemnity claim settlement rates (Item K)].

- (a) Based on Exhibit 1. Paid MCCP costs are excluded from accident years 2011 and subsequent.
- (b) Based on experience evaluated as of September 30, 2020. Reflects an adjustment for the pharmaceutical cost reductions to restate the historical medical paid-to-date ratios at a 2018 pharmaceutical cost level.
- (c) See Exhibits 2.6.1 and 2.6.2.
- (d) The developed medical loss ratios shown were derived based on an adjustment for pharmaceutical cost reductions. They are only for purposes of projecting future medical loss ratios and do not reflect true estimates of ultimate loss ratios for those accident years.

- (a) Based on WCIRB evaluations of the average impact of legislative changes on the cost of indemnity benefits. These annual changes in benefits reflect the WCIRB's retrospective estimates of the cost impact of recent legislation as reflected in emerging post-reform costs. The annual cost impacts have been segregated between claim severity and claim frequency impacts.
- (b) These impacts are based on the weekly wages (See Exhibit 5.1) of injured workers and the legislatively scheduled benefits for that year. Values for 2017 and prior have been updated to reflect a recent WCIRB reassessment of the impact of wage inflation on indemnity benefit levels.
- (c)  $\{ [\text{Column (1)} / 100 + 1.0] \times [\text{Column (2)} / 100 + 1.0] \times [\text{Column (3)} / 100 + 1.0] - 1.0 \} \times 100$ .
- (d) These factors represent the combined impact of the annual benefit changes on claim severity shown in Column (1), claim frequencies shown in Column (2) and wage inflation impact on benefits shown in Column (3), adjusted to the 2020 level.
- (e) On-level factors for accident years 2002, 2003 and 2004 adjust the portion of permanent disability claims that are estimated to not be subject to the January 1, 2005 PDRS (95% for accident year 2002, 75% for accident year 2003 and 40% for accident year 2004) to the January 1, 2005 PDRS level, and adjust for the corresponding utilization impacts on all 2002, 2003 and 2004 indemnity claims.

**Annual Medical Cost Level Change - Non-Legislative**

(a) From a Special Carrier Study through 1990. Based on WCIRB's Aggregate Indemnity and Medical Costs Calls for years 1991 through 2012. Based on WCIRB medical transaction data from 2013 onwards. Accident years 2011 and subsequent do not include MCCP costs.

(b) Based on the WCIRB's evaluation of the cost impact of changes in the medical fee schedules.

(c) Based on a component of the Consumer Price Index. Projections furnished by the California Department of Finance.

(d) Adjusted CPI on workers' compensation medical costs that are not subject to fee schedules. The current year impact is the weighted average of 0% and Column (4), with Columns (1) and (2) from prior years as weights. (i) 1993's non-fee proportion is reduced by 13.8% due to the new medical-legal fee schedule enacted in 1994. (ii) 1998's non-fee proportion is reduced by 7.7% due to the Inpatient Hospital Fee Schedule (IHFS) effective 4/1/1999. (iii) 2002's non-fee proportion is reduced by 7.6% due to the new pharmaceutical fee schedule effective 1/1/2003. (iv) 2003's non-fee proportion is reduced by 17.2% due to the outpatient fee schedule effective 1/1/2004. (v) Given the anticipated impact of legislative reform, a 0% inflation rate has been assumed for 2004 and 2005.

(e) Column (6) = Column (3) + Column (5).

**Annual Medical Cost Level Change - Legislative**

2016	1.8	1.183
2017	4.3	1.134
2018	4.1	1.090
2019	4.0	1.048
Projected:		
2020	2.0	(b)
2021	1.6	
11/1/2021	1.1	(Annual = 3.2)

- (a) Historical wage changes through 2018 are based on Bureau of Labor Statistics data. Forecasts for 2019 and forward are based on the average of wage level projections made by the UCLA Anderson School of Business as of September 2020 and those made by the California Department of Finance as of April 2020.
- (b) The average wage change for 2020 was judgmentally decreased by 0.8% to reflect the estimated difference between growth in median wages and average wages during a recession.

- (a) See Exhibit 5.1.
- (b) Based on WCIRB calendar year experience calls. The industry average charged rates reflect most rating plan adjustments but do not reflect the application of deductible credits or retrospective rating plan adjustments.
- (c) Reflects (1) advisory pure premium rate level changes to bring premium to the advisory January 1, 2020 pure premium rate level and (2) an additional adjustment factor, which is the ratio of the average advisory January 1, 2020 pure premium rate (\$1.52) to the industry average filed pure premium rate as of July 1, 2020 (\$1.80).
- (d)  $(2b) \div (2a)$ . This column adjusts premiums at the industry average charged rate level to the industry average filed pure premium rate level as of July 1, 2020.
- (e) Based on unit statistical data.
- (f) Based on average promulgated experience modifications. Calendar years 1996 through 2000 include adjustments for the impacts of AB 1913 and SB 1217 (1998).
- (g) Based on a comparison of premium reported on a calendar year basis to premium reported on an estimated ultimate policy year basis over the course of two accident years. The factor is applied only for calendar years 2007 to 2010, during which reported premiums were impacted by recessionary economic forces.
- (h)  $(1) \times (2c) \times (3) \times (6) \div [(4) \times (5)]$  for calendar years 2007 to 2010.  $(1) \times (2c) \times (3) \div [(4) \times (5)]$  for all other calendar years.

**Y = Hazardousness-Adjusted Noncumulative Indemnity Claim Frequency**

Constant	-0.020
Std Err of Y Est	0.040
R Squared	0.566
No. of Observations	40
Degrees of Freedom	35

X Coefficient(s)	0.178	0.273	0.103	-0.145
Std Err of Coef.	0.072	0.061	0.043	0.076

**Notes:**

Indemnity Benefit Level variable is leading. The benefit level change for AY 2004 is related to the AY 2003 change in non-cumulative frequency.  
The Indemnity Benefit Level change for Ogilvie & Almaraz / Guzman in 2009-2010 is not leading.  
The Indemnity Benefit Level variable excludes indemnity benefit utilization, and changes in the death and permanent total benefits.  
The Indemnity Benefit Level variable has been revised due to on-leveling reassessments. See Actuarial Committee item AC09-03-03.  
For 1993 on, cumulative claims include both cumulative trauma and occupational disease claims. See March 19, 2014 Actuarial Committee Agenda Item III.  
Economic variables are historical through 2019; June 2020 UCLA Anderson Forecasts for 2020 on.  
Regression is over AY 1979 through AY 2018. AY 2019 through AY 2022 are projections.  
The constant term, -0.020, consists of measured offsets that recognize annual changes in real benefit levels relative to nominal benefit levels and long-term economic growth. Without these offsets, the indemnity benefit level and economic variables would project frequency to increase without bound.  
\*AY 2018 change is based on a comparison of 2018 accidents on 2017 policies to 2017 accidents on 2016 policies.  
The Cumulative Injury Index forecast for 2020 and 2021 is based on the average change from the prior two recessions.

**Projection of Indemnity Severity Trends by Accident Year  
Based on Experience as of September 30, 2020**

Accident Year	(1) Estimated Ultimate Severity	(2) Annual % Change	(3) Indemnity Adjustment Factor (a)	(4) Ultimate On-level Severity (1) x (3)	(5) Annual % Change

Selected Medical Severity Trend: 2.5%

- (a) Estimated ultimate severities for all accident years are derived by dividing ultimate medical losses on indemnity claims by ultimate indemnity claim counts. The estimated ultimate medical severities were derived from the projected ultimate loss ratios shown in Exhibit 3.2, column (6).
- (b) These adjustment factors are based on Exhibit 4.4, excluding the impact of frequency, and including the impact of SB 1160 provisions applicable to outstanding medical losses.
- (c) Severities for accident years 2011 and subsequent do not reflect the cost of medical cost containment programs (MCCP). Severities for accident years 2010 and prior do reflect MCCP costs.

Source: WCIRB experience calls.

Estimated Annual Exponential Trend								
Trend Based on 1990 to 2019:				5.3%	N/A			
Trend Based on 2005 to 2019:				1.6%	1.4%			
Trend Based on 2015 to 2019:				0.0%	-0.3%			

Selected Medical Severity Trend: 2.5%

- (a) Estimated ultimate severities for all accident years were derived by dividing ultimate medical losses on indemnity claims by ultimate indemnity claim counts.  
 (b) Adjustments to accident years 2005 through 2010 based on WCIRB's Annual Calls for Direct California Workers' Compensation Aggregate Indemnity and Medical Costs.  
 (c) Ultimate severities are on-leveled based on adjustment factors shown on Exhibit 6.3.

Source: WCIRB experience calls.

Notes All figures in each accident year contain information from the same combination of insurers, all of whom submitted complete data for all evaluations for that accident year. Therefore, each accident year may contain a different mix of insurers (ranging from 85% to 100% of the total California workers' compensation insured market measured using 2019 earned premium levels).

### California Workers' Compensation Estimated Indemnity Claim Frequency by Accident Year

**Note:**

The 2019 and 2020 estimate is based on a comparison of claim counts based on WCIRB accident year experience as of September 30, 2020 relative to the estimated change in statewide employment. Prior years are based on unit statistical data.

## **Item AC20-12-02**

### **Review of Projections Based on 9 Months**

Beginning with the September 1, 2021 filing, the WCIRB's annual pure premium rate filing will be submitted in April with a September 1 effective date. The filing submitted in April will be based on December 31 experience and in part predicated on the projection of the most recent accident year experience evaluated at 12 months. At the December 5, 2019 meeting, the Committee recommended that projections based on accident year experience evaluated at 9 months be reviewed in December to provide a preliminary indication of loss cost trends using the most recent accident year. Staff has conducted a review of the 9-month accident year experience including estimating the relative accuracy of the 9-month data projecting the experience for the full accident year.

Staff reviewed indemnity frequency changes evaluated at the end of each year compared to after 9 months from 2007 to 2019. Staff analyzed these data points and calculated the 95% confidence interval estimations of the 12-month data from the 9-month data. In order to properly model the frequency change and evaluate the effectiveness of the model, staff split these data points to two groups. The model training group includes data from 2007 to 2016 (77%) and the model validation group includes data from 2017 to 2019 (23%). In the model training group, 2009 was an outlier, so staff excluded it from this study. (Staff conducted additional analysis including 2009 in the training group and the width of the confidence interval is more than double when including 2009.)

Based on this study, the 95% confidence interval estimation for the frequency change at 12 months is between -0.8% and +0.9% from the 9-month change.<sup>1</sup> The confidence interval is intended to estimate the average difference for the population as a whole. However, each individual observation will have a lower degree of predictability compared to the population average. As a result, staff also prepared a wider prediction interval which is based on twice the standard deviation of the differences, which resulted in the 12 months change being -3.3% to +3.3% from the 9-month change. The validation group data shows 2017 and 2018, the actual frequency changes sat well within the population 95% confidence intervals. Data from 2019 was slightly outside the population 95% confidence interval but was well within the prediction interval. Exhibit 1 shows the 95% confidence and prediction intervals for each accident year based on the 9-month data. In the future, staff will continue to dynamically adjust the training group and validation group in order to recalibrate the model. Based on this study, staff believes that the 9-month data is reasonable indication of the full year frequency changes.

Staff reviewed paid/incurred indemnity severity changes and paid/incurred medical severity changes evaluated at the end of year compared to after 9 months from 2005 to 2019. Similar to the frequency change analysis, staff also split these data points into two groups. The model training group includes data from 2005 to 2016 (80%), the model validation group includes data from 2017 to 2019 (20%). Exhibits 2.1 to 2.4 show the 95% confidence and prediction intervals for each accident year based on the 9-month data, which were computed similarly to the analysis of claim frequency changes. Based on this study, staff noted the following:

1. The 95% confidence interval estimation for the paid indemnity severity change at 12 months is between -0.8% to +0.8% from the 9-month change, while the wider prediction interval estimation is between -2.4% to +2.4% (Exhibit 2.1). In the validation group, 2017 and 2018 actual 12-month severity changes were well within the 95% confidence intervals. The severity change for 2019

---

<sup>1</sup> For this study, the sample size was small. Student's t-distribution is a large family of distributions that are similar in shape to the normal standard distribution, but adjusted to account for smaller sample sizes. As a result, staff decided to use Student's t-distribution to find the confidence interval for this study. Staff used the sample mean plus and minus the margin of error to calculate the confidence interval for the frequency change at 12 months.

was outside both the 95% confidence and prediction intervals. In general, paid indemnity at 9 months is mostly for temporary disability with most claims not yet settled. As a result, the predictability of the 9-month indemnity severity change for the full accident year change may be limited.

2. The 95% confidence interval estimation for the incurred indemnity severity change at 12 months is between -0.7% to +2.3% from the 9-month change, while the wider prediction interval estimation is between -4.5% to +4.5% (Exhibit 2.2). In the validation group, 2017 and 2018 actual 12-month severity changes were well within the 95% confidence intervals. The severity change for 2019 was slightly outside the range for both the confidence and prediction intervals. As noted above, there may be limitations on the predictive value of 9-month indemnity severities given the immaturity of the claims.
3. The 95% confidence interval estimation for the paid medical severity change at 12 months is between -2.1% to +1.6% from the 9-month change, while the wider prediction interval estimation is between -5.5% to +5.5% (Exhibit 2.3). In the validation group, each year's 12-month change was well within the prediction interval.
4. The 95% confidence interval estimation for the incurred medical severity change at 12 months is between -1.4% to +1.9% from the 9-month change, while the wider prediction interval estimation is between -4.9% to +4.9% (Exhibit 2.4). In the validation group, 2017 and 2018's actual 12-month severity changes were well within the prediction range. The severity change for 2019 was slightly outside the prediction interval. (The unanticipated negative medical severity change for 2019 has been discussed at prior meetings.)

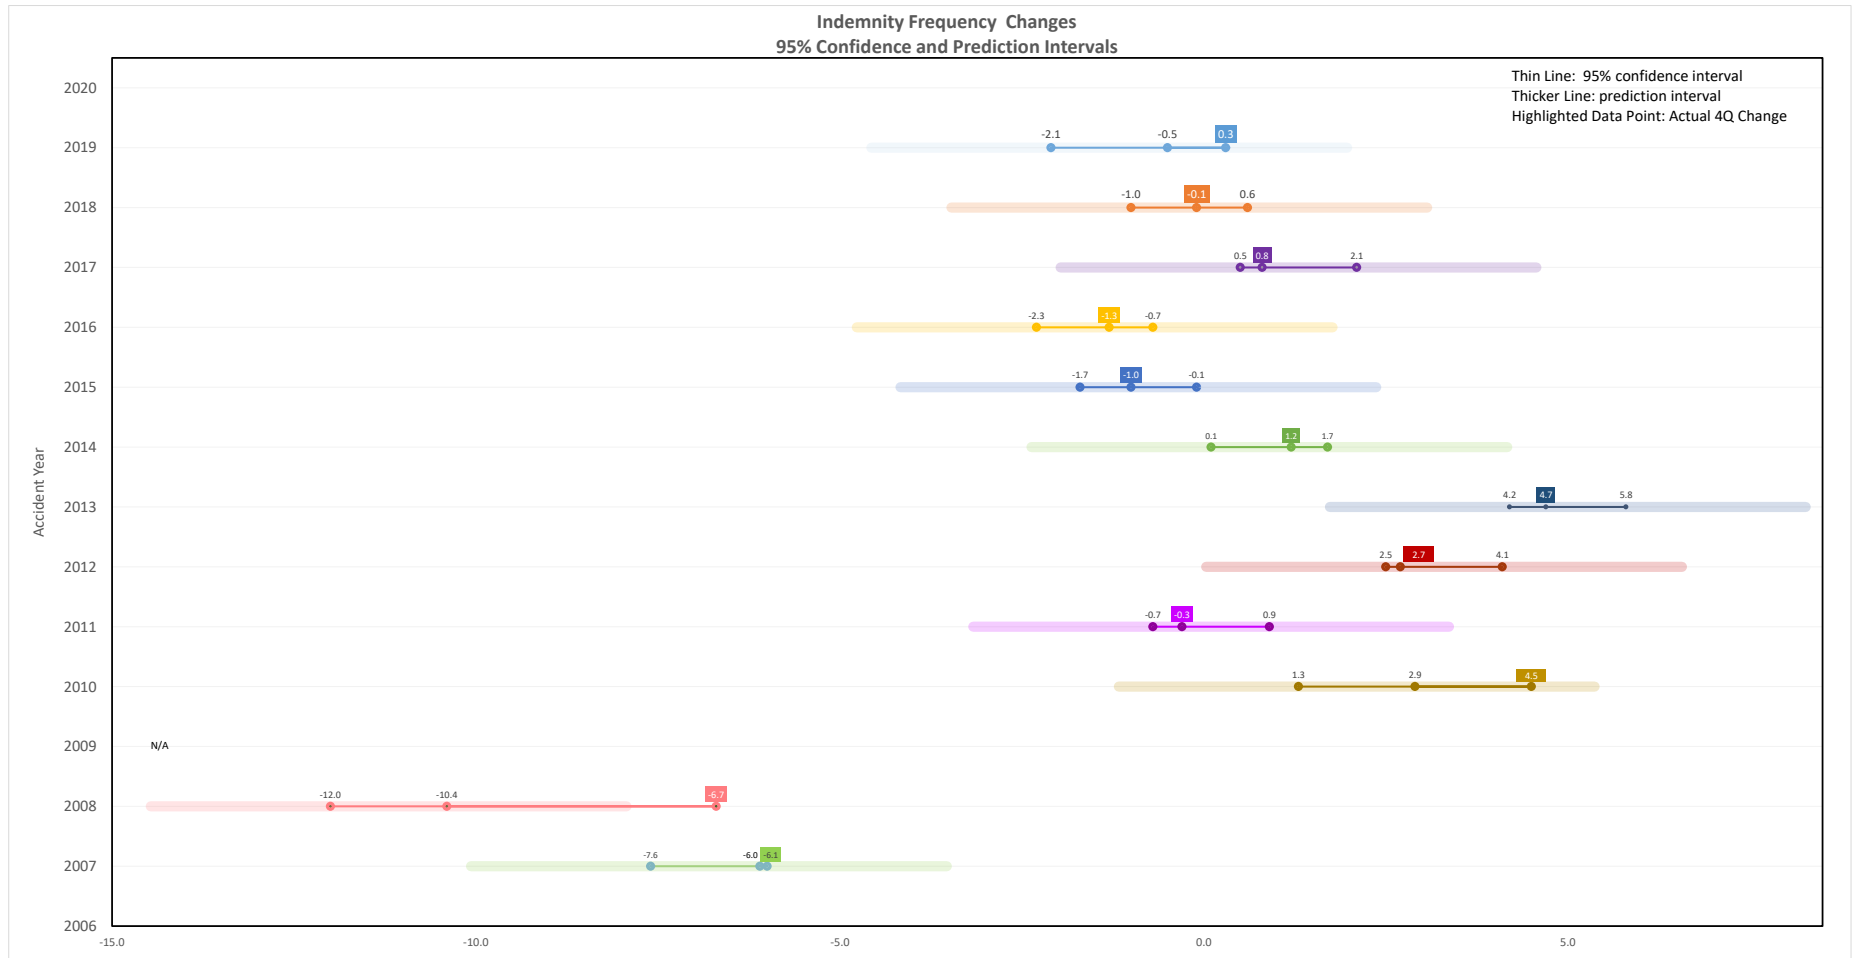

Based on this review, the predictability of the 9-month indemnity severity change for the full accident year change may be limited. However, staff believes that the 9-month data can be used as a reasonable indication of the direction and approximate magnitude of the full year medical severity changes.

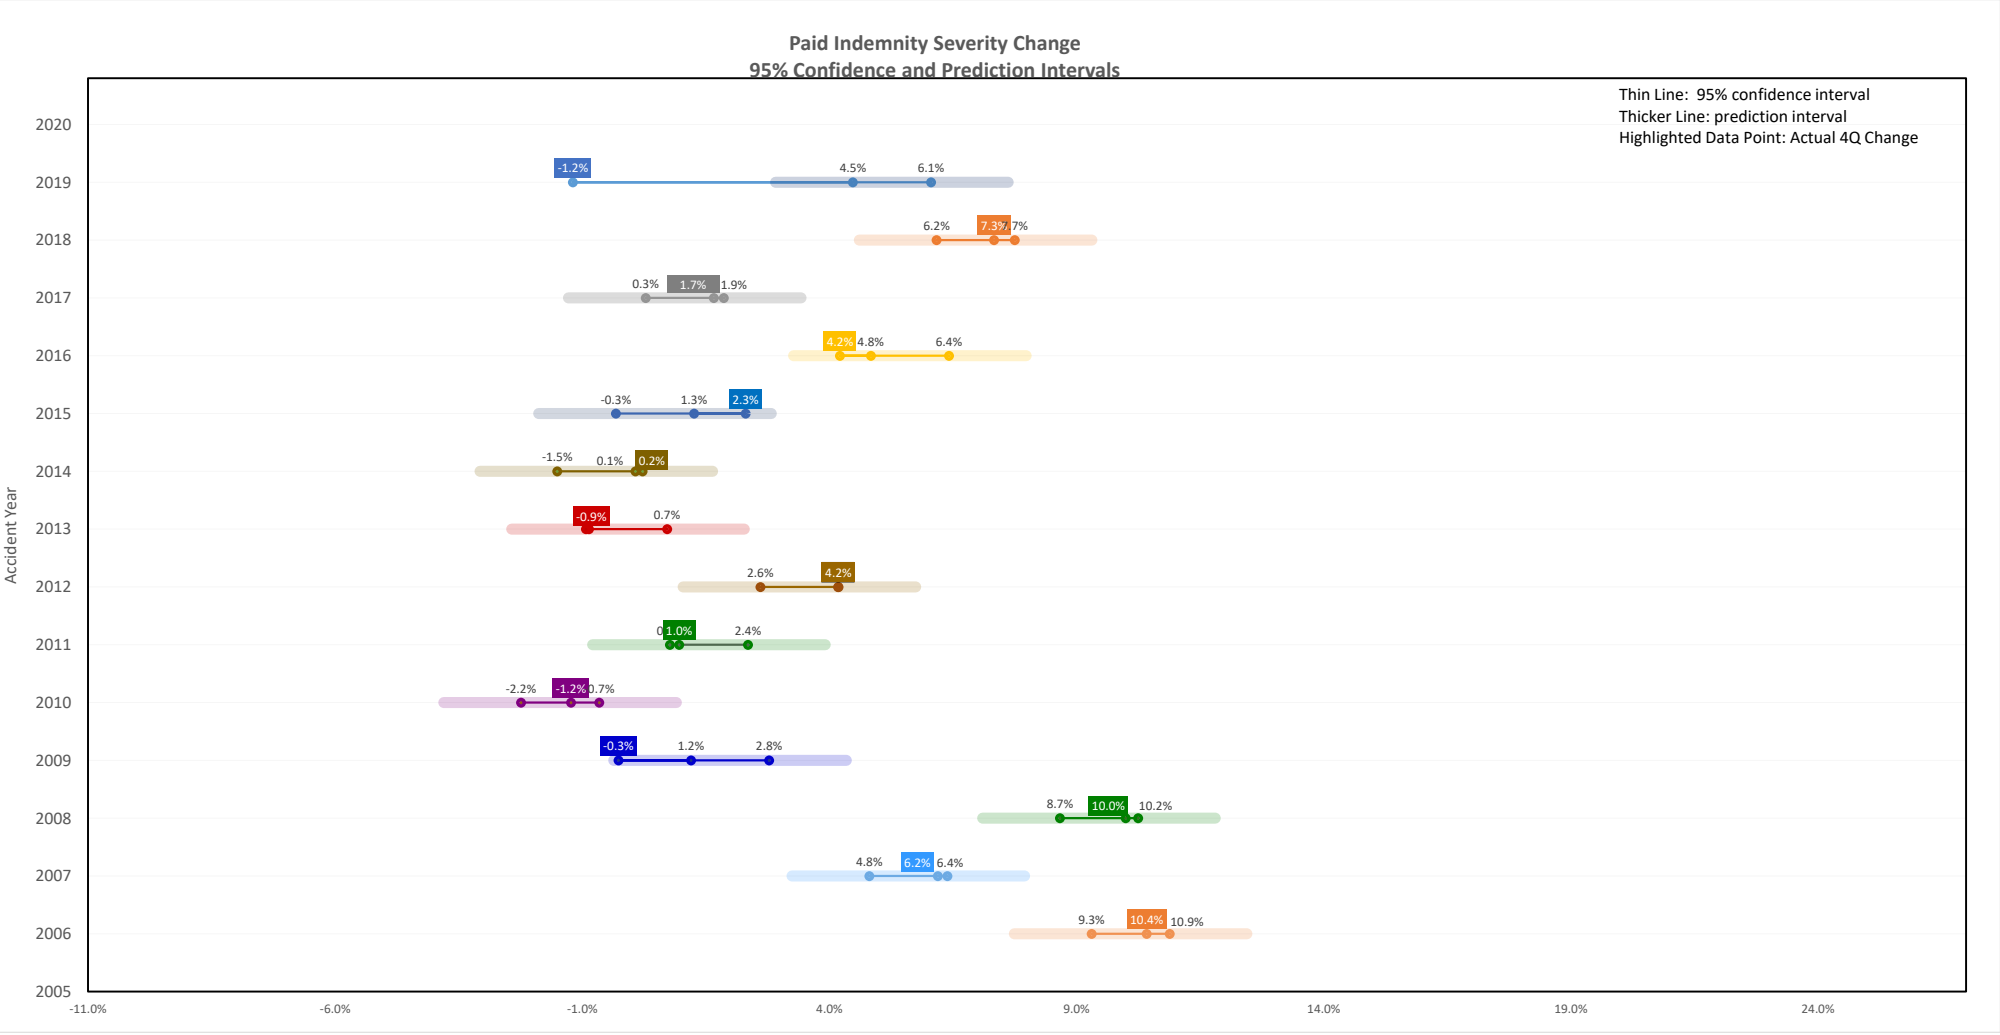

Staff reviewed the historical 9-to-12 months loss development factors (LDFs) for incurred indemnity losses, incurred medical losses, paid indemnity losses and paid medical losses. As shown on Exhibits 3.1 and 3.2, these LDFs were relatively stable from 2005 to 2018. As a result, staff used a 5-year moving average to project the 9-to-12 months LDF for the coming year. To compute a loss ratio at 12 months, staff also reviewed the earned premium development evaluated at the end of 9 months compared to the end of 12 months. From the historical data as shown in Exhibit 3.3, staff noticed that premium development was stable and selected a 5-year moving average of the historical development factors to develop the earned premium from the end of the 9 months to the end of 12 months. Using these development approaches, the 2019 estimated loss ratio at 12 months using the 9-month data were generally within a 4% (0.2 point) difference compared to the actual 12-month loss ratios, as shown in Exhibit 3.4.

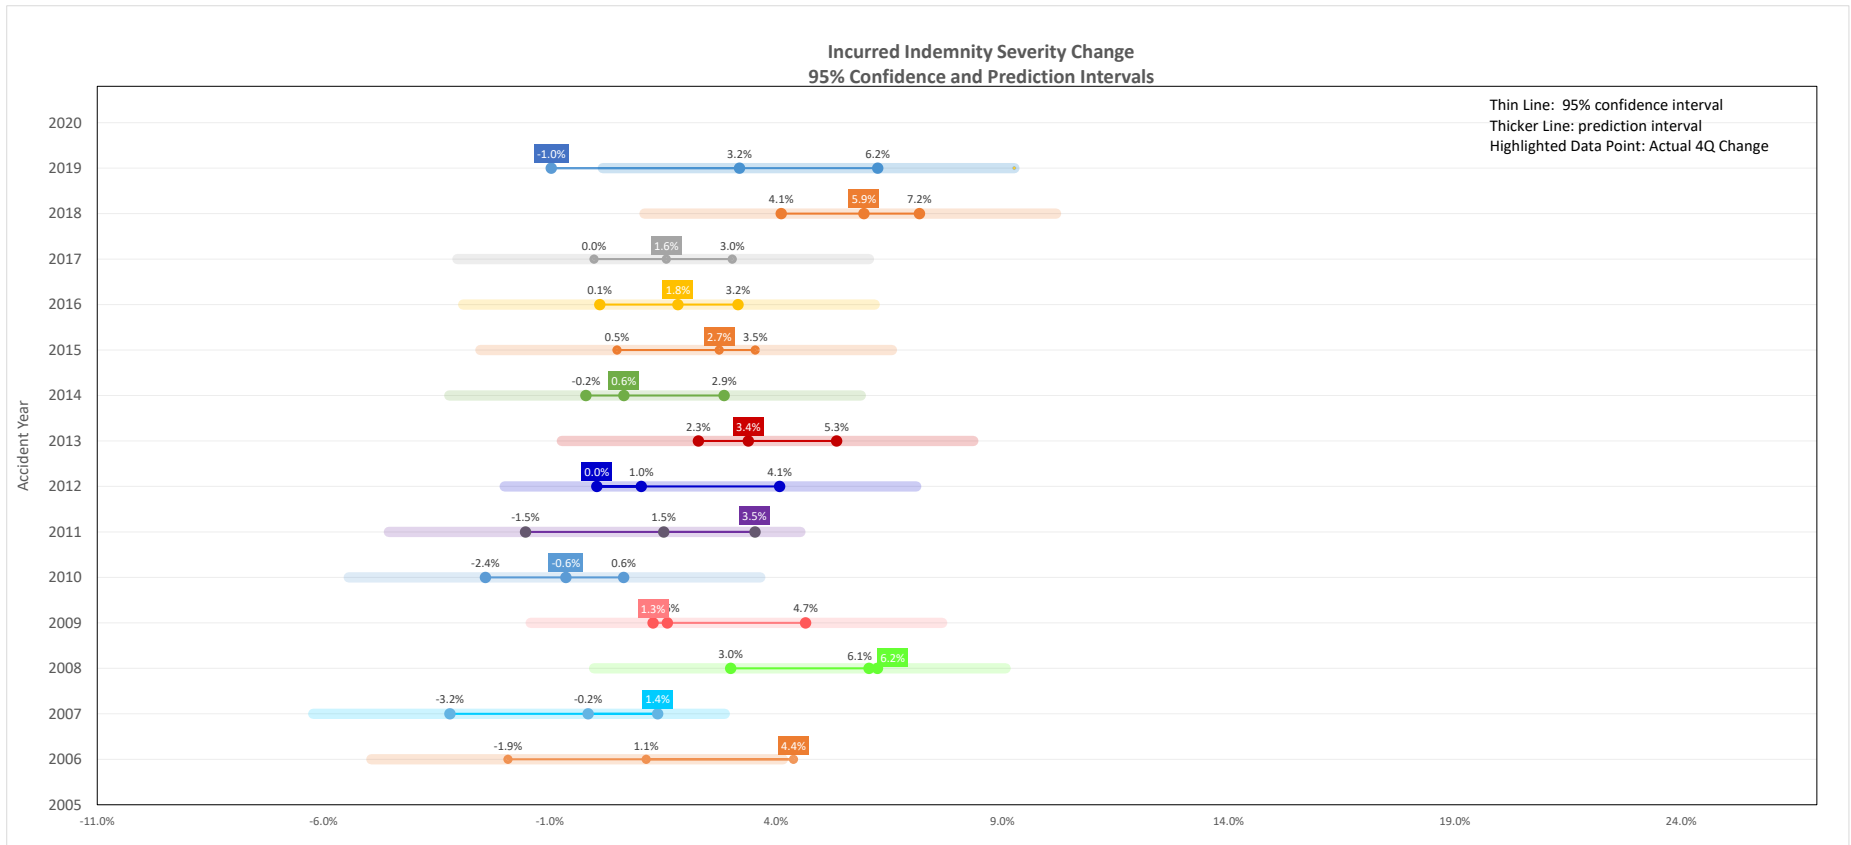

To project ultimate loss ratios based on 9 months, staff used 9-to-12 months factors as described above and 12-to-ultimate loss development factors based on the WCIRB's standard loss development methodologies and using data as of September 30 evaluations. The developed paid indemnity losses and paid medical losses were then compared to the projected ultimate loss ratios from the subsequent (December 31) evaluation. As shown in Exhibit 3.5 for accident year 2019, the projected paid indemnity ultimate loss ratios based on the 9-month data and that based on year-end data were 25.73% and 25.94%, respectively. The projected paid medical ultimate loss ratios based on the 9-month data and that based on year-end data were 28.44% and 30.07%, respectively.

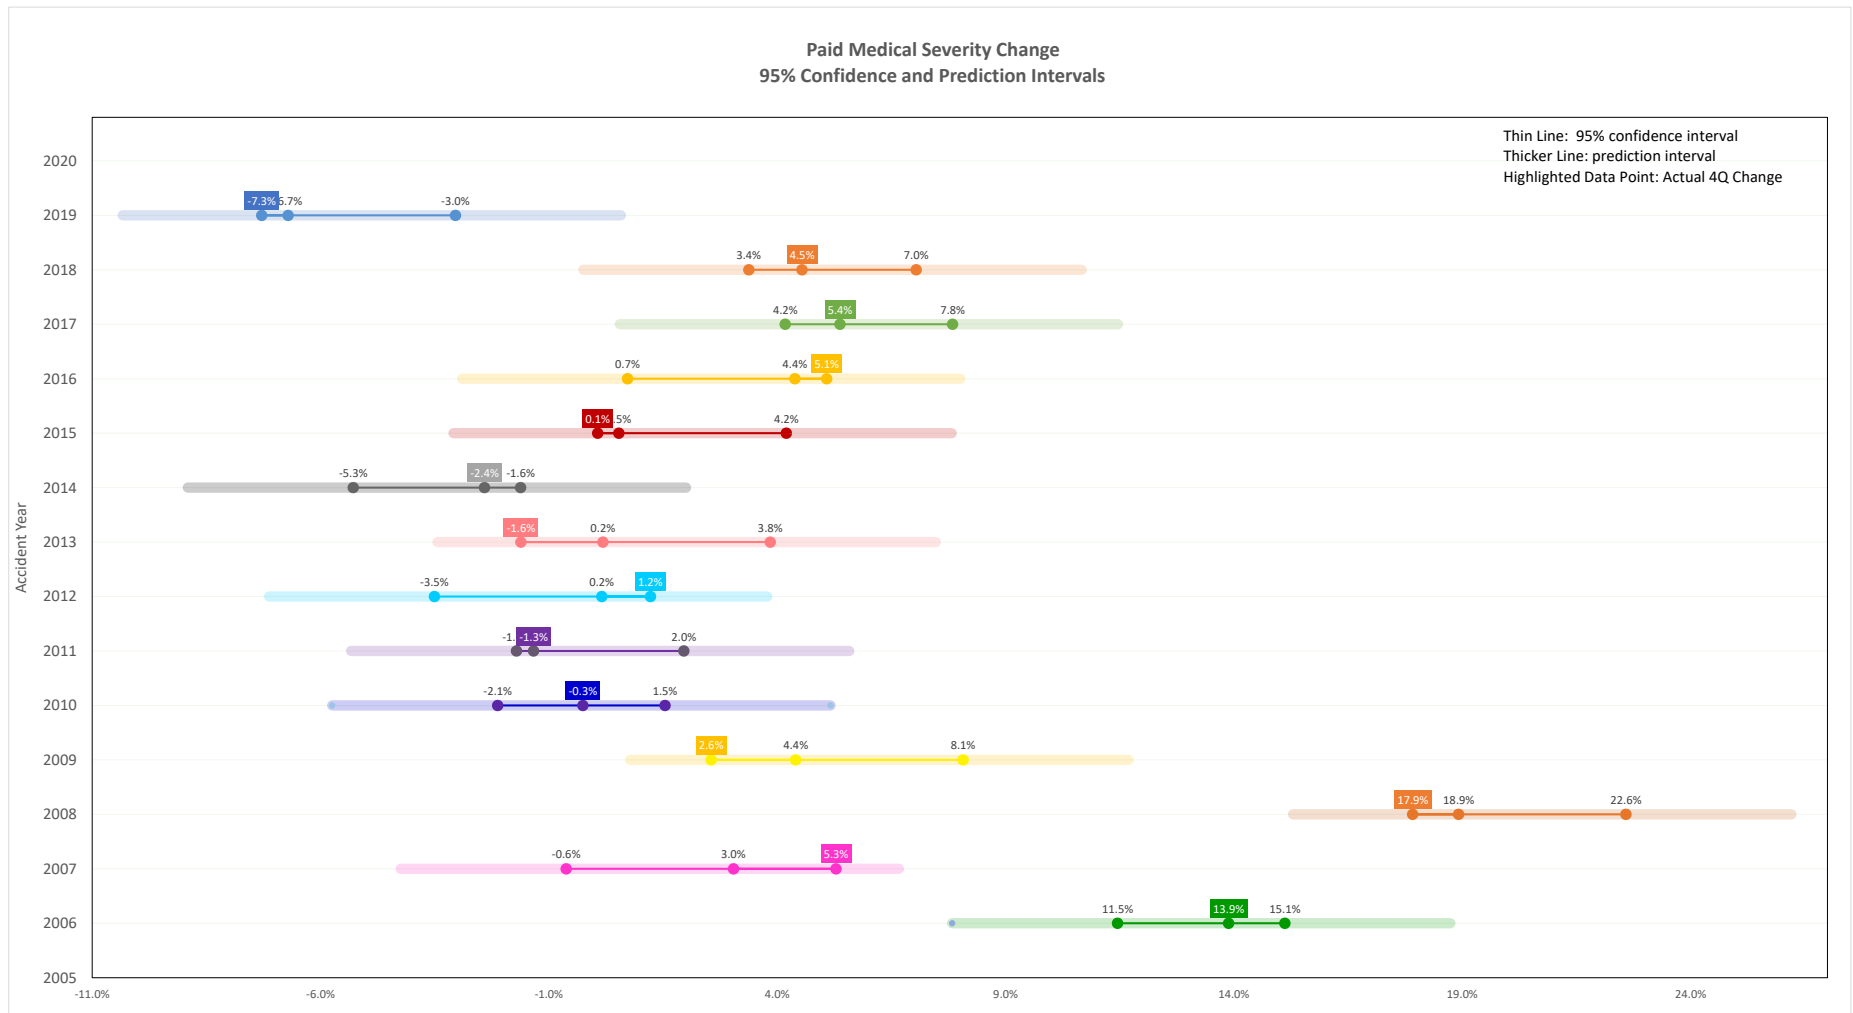

Staff believes this framework will provide some context of the 9-month data as it is reviewed in preparation of the annual pure premium rate filings in the future. However, it may be more difficult than usual to make inferences from the 9-month information in 2020 as it is impacted by many factors related

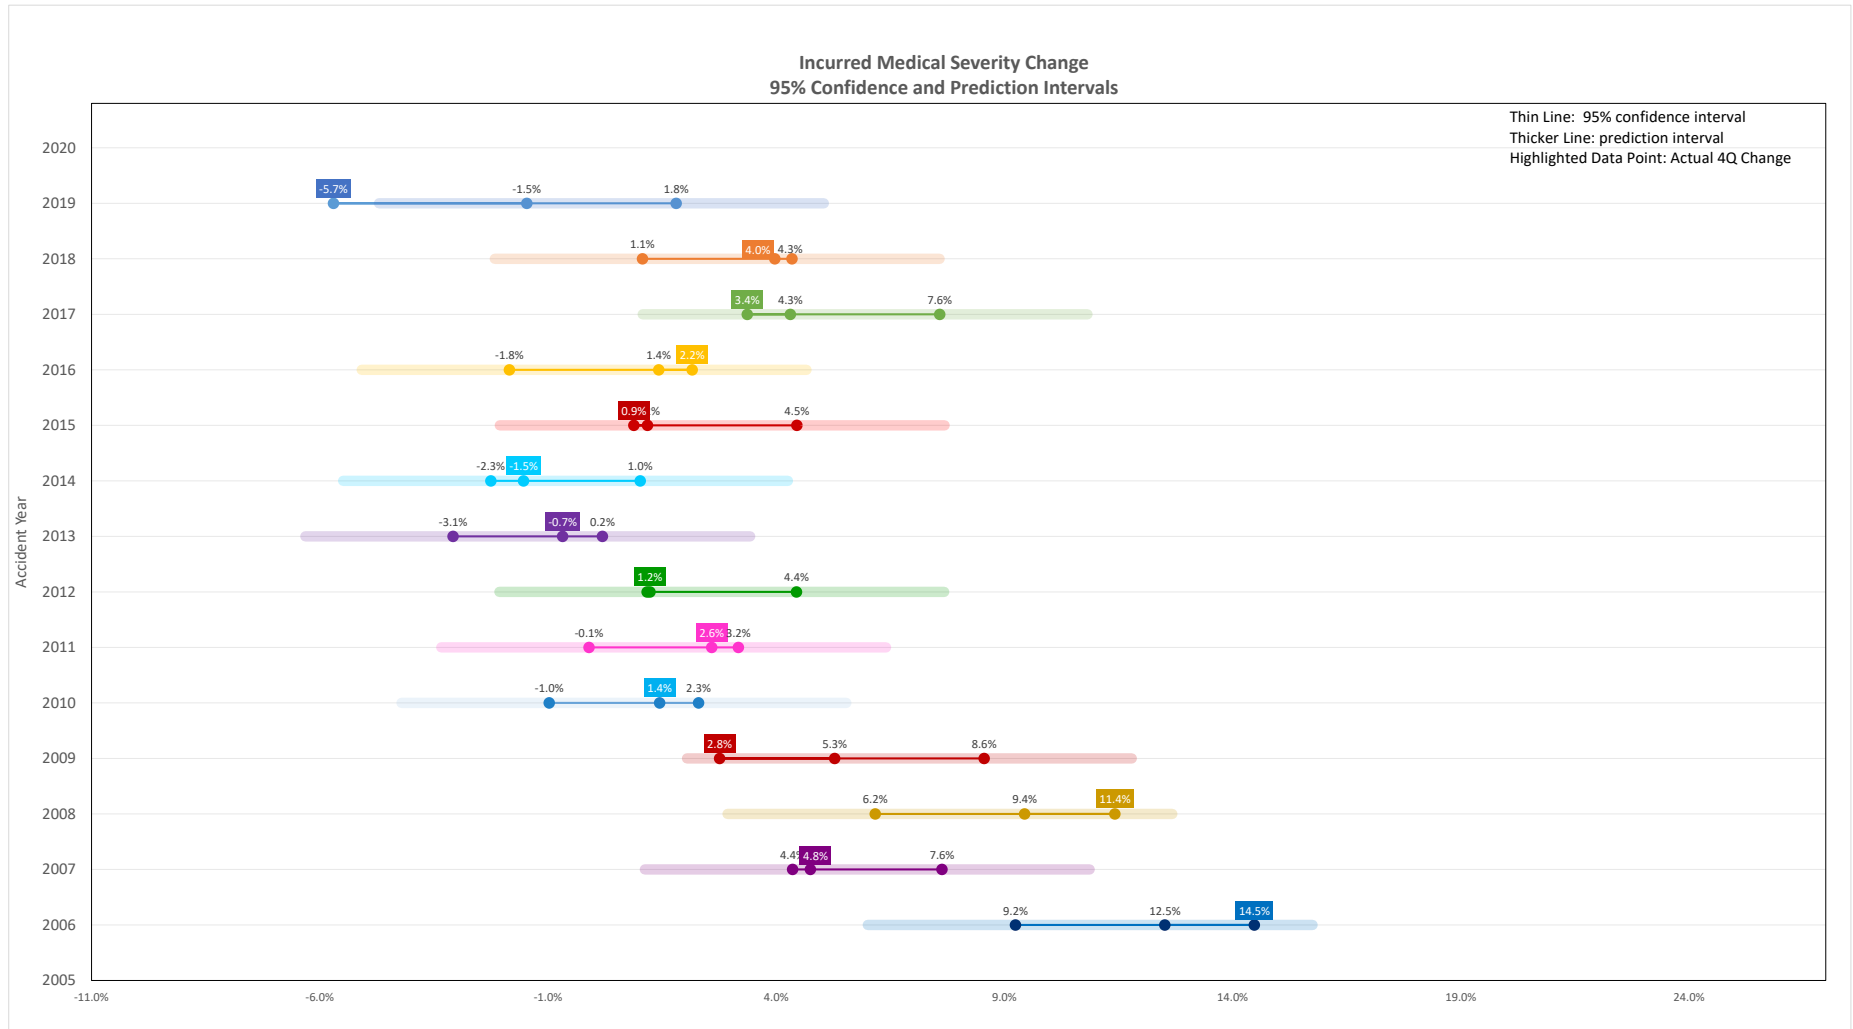

to the COVID-19 pandemic and historical relationships between 9 months and 12 months experience may not be applicable to accident year 2020. Additional information on accident year 2020 experience through 9 months will be presented at the meeting.

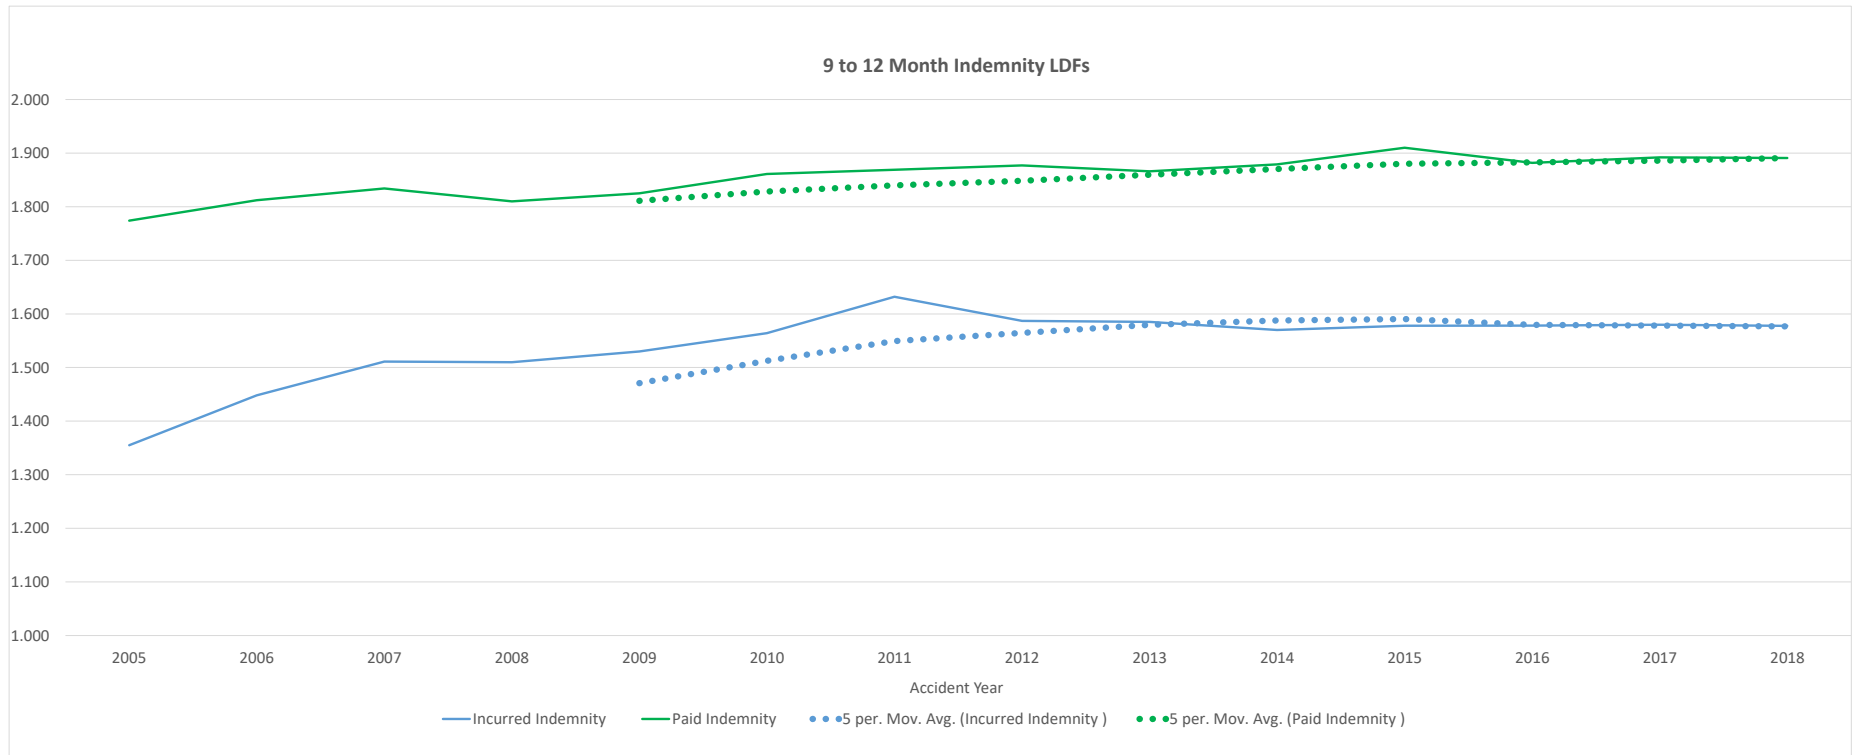

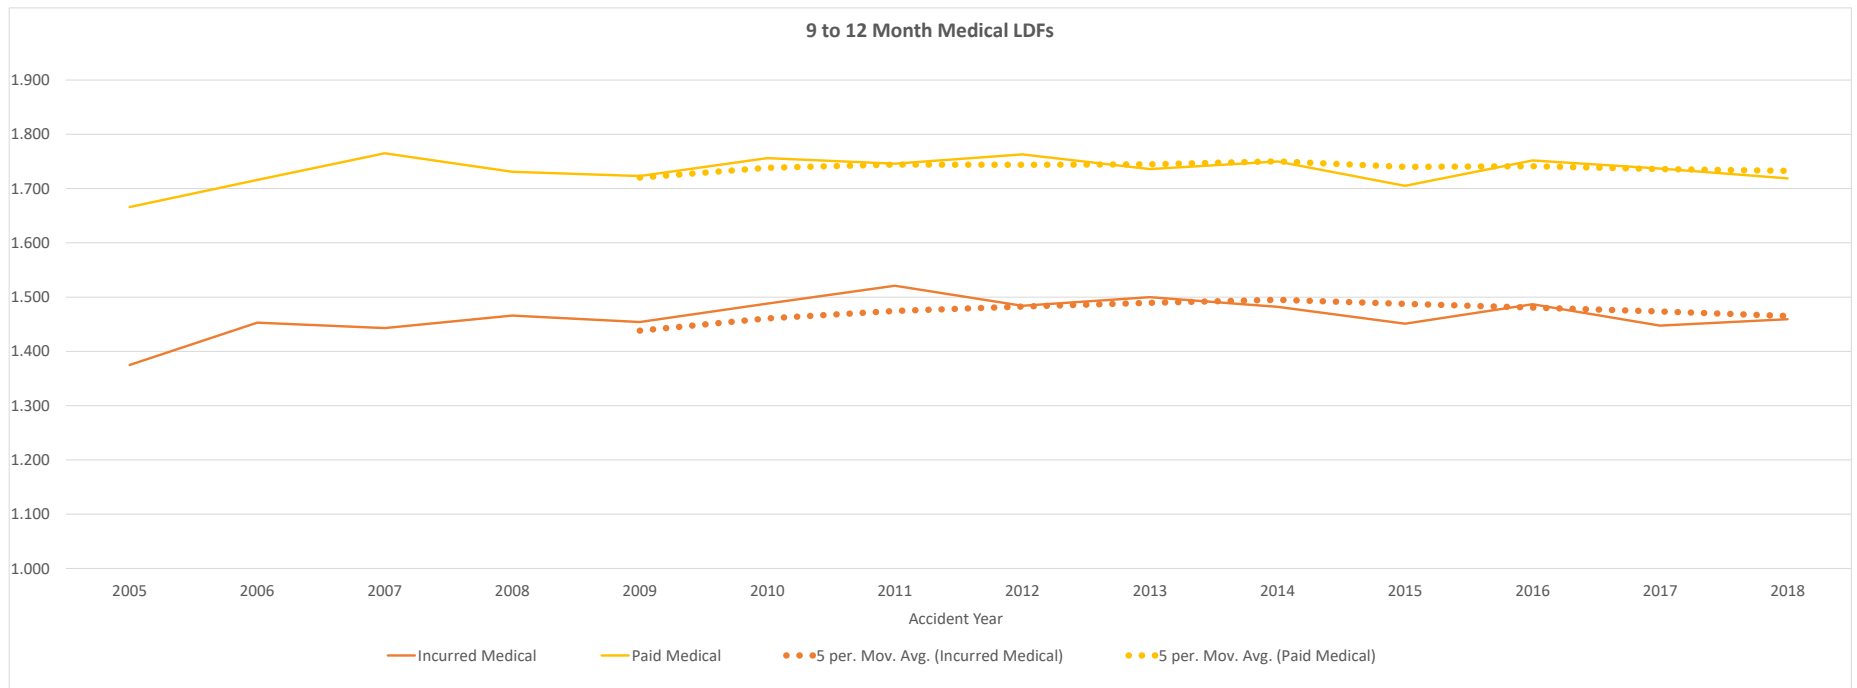

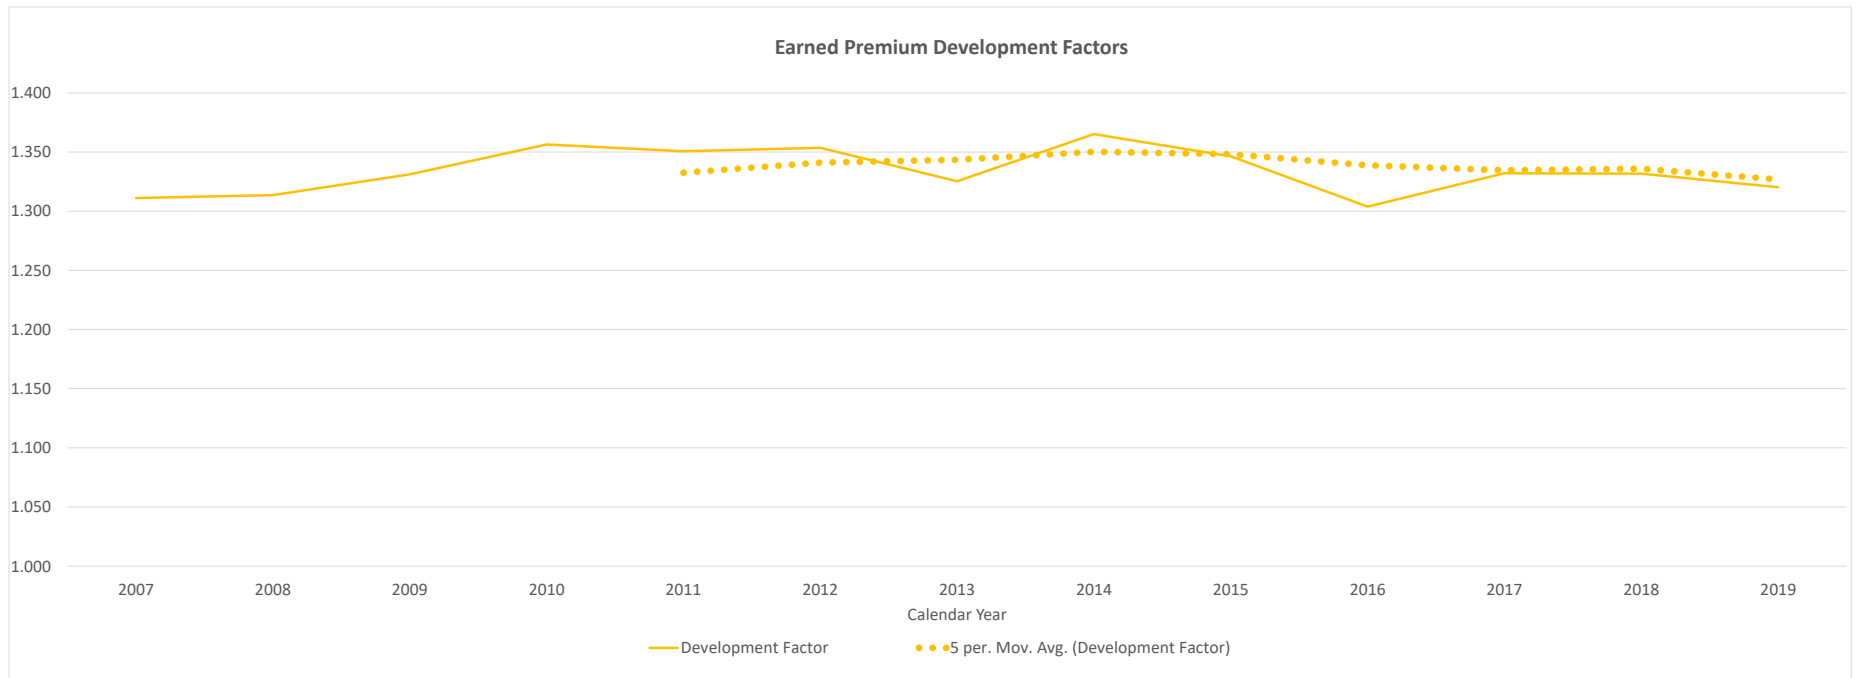

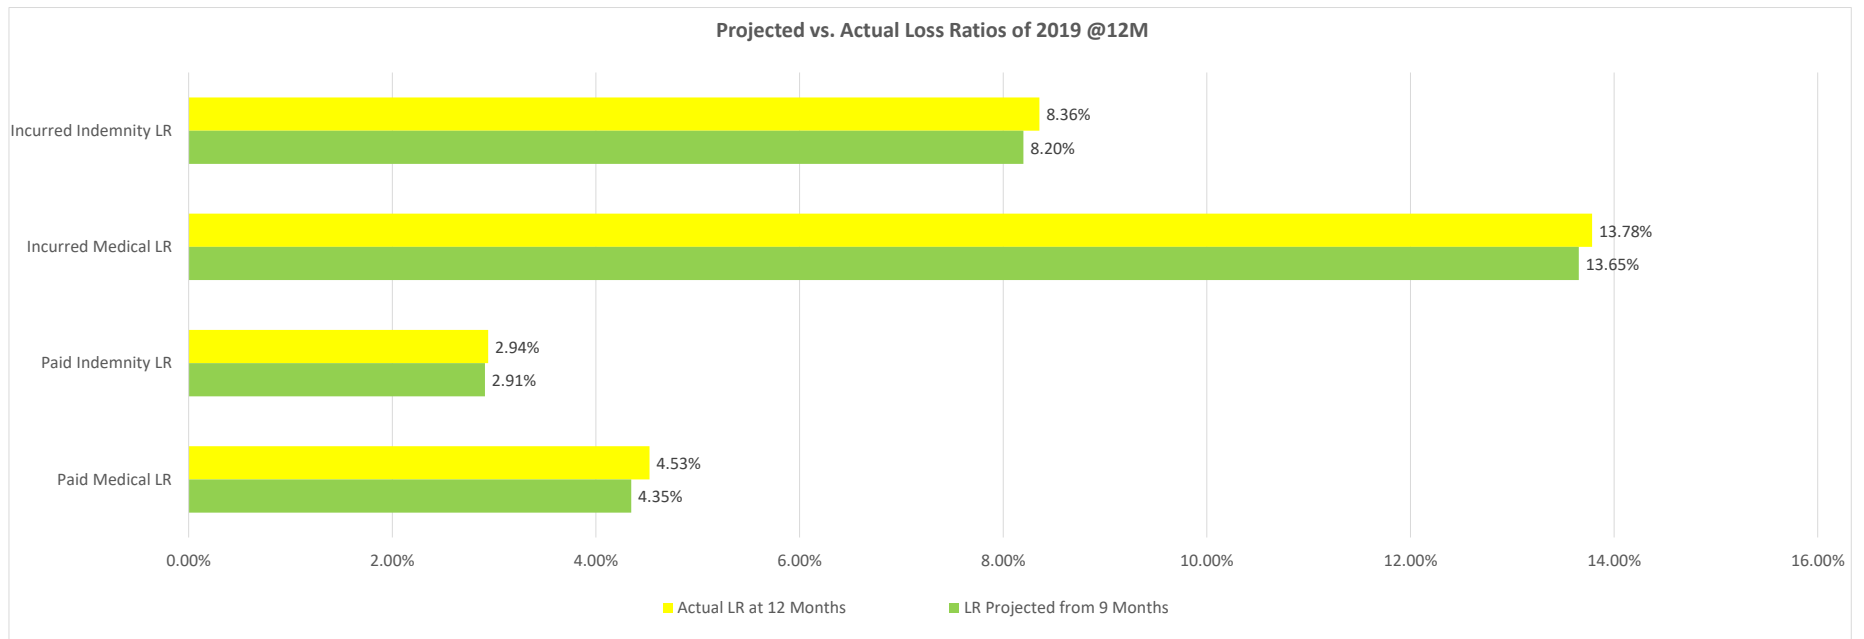

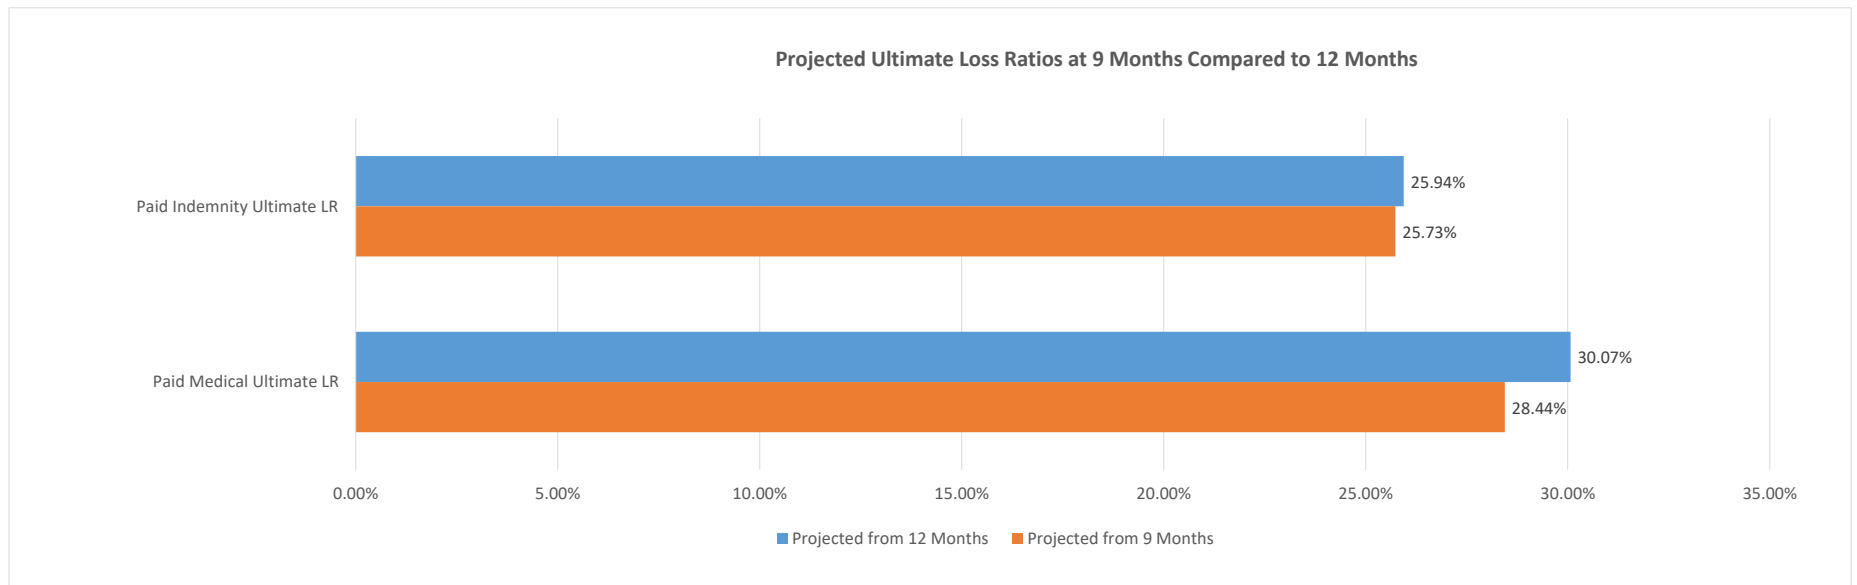

## **Item AC20-12-03**

### **Classification Ratemaking Loss Development**

Since 2008, the WCIRB has combined classifications with similar loss development patterns and used the incurred loss development patterns of the group as a whole to develop incurred losses reported-to-date for each classification to an ultimate basis for purposes of classification ratemaking. Separate groupings of classifications are used for indemnity and medical losses. The WCIRB enhanced the process in 2012. Initially, there were eight loss development groups. Over time, the differentiation among groupings eroded and the initial groups were merged into four loss development groups for both indemnity and medical losses.

In the current process, unlimited indemnity and medical losses evaluated at first through fifth unit statistical report level are developed separately based on their assigned loss development groups. Individual losses are then trended and on-leveled before being limited to \$500,000. See Section C, Appendix C of the WCIRB's January 1, 2021 Regulatory Filing for a complete description of the classification ratemaking process.

Staff completed an analysis of the WCIRB's current loss development groups as well as several alternative groupings based on claims characteristics. This preliminary analysis was presented to the Actuarial Research Working Group (ARWG) at the March 3, 2020 meeting with an updated analysis presented to the ARWG at the October 6, 2020 meeting. The analyses showed that the current loss development grouping approach could be enhanced to better capture the development pattern for each classification.

The current loss development group methodology has been re-optimized and additional options have been developed and presented for consideration. An overview of the methodology and development of the recommended groupings are discussed below.

#### **Background**

The core methodology for defining the current loss development groups reflects an iterative Kruskal Wallis test applied to classifications' development relativities. The Kruskal Wallis test is a non-parametric analysis of variance on ranks. For each classification, the median relativity over observed years was selected to compute the H statistic<sup>1</sup> which measures the differences between sets of observations. The observation with the maximum H statistic is the optimal point to bifurcate the total group into two sub-groups. The process was repeated to generate the final groups. An analysis of the share of explainable variance was used to select the best number of groupings. An example is shown in Exhibit 1.

#### **Limited Loss Development on Open Claims**

This analysis uses the WCIRB's unit statistical report data for policy years 2011 to 2016 at all available report levels. Staff began by calculating the loss development factor relativities and their corresponding rankings for the current loss development groups which are shown in Exhibits 2.1 through 2.4.

Based on feedback from the ARWG, staff reviewed classification loss development on a limited loss basis. Losses from individual claims were trended and on-leveled and then limited to \$500,000. Staff compared segmentation options based on the development of these losses. For the first alternative to re-optimize classification-based loss development groups, staff developed a set of groupings using data from open claims only to segregate classifications into groups as loss development on open claims

---

<sup>1</sup> The H statistic is the unique symmetric unbiased estimator for a central moment of a distribution. The formula is

$$H = (N - 1) \frac{\sum_{i=1}^g n_i (\bar{r}_i - \bar{r})^2}{\sum_{i=1}^g \sum_{j=1}^{n_i} (r_{ij} - \bar{r})^2}$$

showed more consistent differentiation. The resulting groups were applied to all claims afterward as the groups developed using data on open claims also segmented development well for closed claims. The information for optimized groupings using limited losses on open claims can be found in Exhibits 3.1 through 3.4.

Staff also evaluated the appropriateness of loss development using a combination of class groupings for open claims and a separate group for closed claims. For each classification, indemnity and medical loss costs on open claims were developed to the latest report level using the loss development factors calculated based on the open claims from the assigned loss development group. Loss development factors for closed claims were developed based on the experience of closed claims and applied to all closed claims. Staff believes this is a reasonable approach due to the minimal differentiation in the development of closed claims for either medical or indemnity loss by any of the groupings. The performance of this approach was tested and found to outperform the optimized groupings without separating closed claims. The results in Exhibits 4.1 through 4.4 show that closed claims have significantly different development than open claims.

### **Tree Model**

Staff also explored a decision tree model as an alternative to the approach using Kruskal Wallis tests. The decision tree model is a supervised learning method used for classification and prediction. This tree model splits the source set into subsets based on the Gini Index<sup>2</sup> which measures the homogeneity of derived groups. The process is repeated on each subset in a recursive manner to derive the final groupings. The optimal size of groupings was determined by cost complexity pruning, which reduces the size of a learning tree without reducing predictive accuracy as measured by a cross-validation set.

For comparison, staff used the tree model to develop two alternative groupings of classes for loss development. As with the previous alternatives, one set of groups was developed using data on open claims only and the other was developed for open claims with a separate group for closed claims. Using the Gini index as the splitting criteria led to three loss development groups each for indemnity and medical losses. The loss development factor relativities and the rankings for optimized groupings from the decision tree model using limited losses on open claims are shown in Exhibits 5.1 through 5.4. As when using Kruskal Wallis tests, performance was improved once a separate group was added for closed claims. These groupings are shown in Exhibits 6.1 through 6.4.

Staff also explored using claims characteristics for loss development. One advantage of the tree model is that it can be used over multiple categorical variables while the Kruskal Wallis test can be used to optimize over a single variable only. A decision tree model was run with open/closed status, cumulative trauma (CT) status, part of body and type of injury. These characteristics were chosen because they are considered significant drivers of development differences. While CT status was one of the inputs in the model, it was not significantly related to the loss development compared to the other selected variables. Exhibits 7.1 through 7.4 show the loss development factor relativities and the rankings for the groupings derived using this approach. Exhibits 8.1 through 8.3 contain insights from the models using claims characteristics.

### **Performance Test**

A total of 474 classifications were studied. To reduce the volatility, staff excluded small classifications for which experience was not available for all policy years in the study. The assignment of small classifications and any new classifications will be reviewed manually. The performance of the proposed groups is tested using experience from a year after the experience period. For example, the true loss development factor is compared with the geometric mean of loss development factors from the previous two years. This specification was chosen to reflect the calculation of loss development factors in practice.

---

<sup>2</sup> The Gini Index measures the inequality among values. A small value indicates the subgroup contains observation with high similarity. The formula for Gini Index is  $I_G(p) = \sum_{i=1}^J (p_i \sum_{k \neq i} p_k)$

As shown in Exhibits 9.1 through 9.3, the performance of each method is measured and compared for each policy period which is used in classification ratemaking. The calculated errors, squared errors and absolute errors are shown both on observation weighted and loss weighted bases.

At this time, staff recommends retaining loss development groups based on classifications rather than claims characteristics. The groupings based on claims characteristics are promising but do not clearly outperform those based on classifications. Such groupings would also have data challenges based on the consistency of coding for part of body, injury type and claim status across insurers and over time. It would also require more significant changes to the WCIRB's existing classification ratemaking process. This approach remains promising and should be revisited at the next comprehensive loss development methodology review potentially also using diagnostic grouping information from the medical transaction data as a differentiating claim characteristic.

Staff also recommends adopting separate development for open and closed claims as this consistently outperforms the development based on open claims only. This is true for whether the groupings were developed using the Kruskal Wallis Bifurcation model or the decision tree model. The performance of the groupings developed by the two models was very similar. The grouping of classification codes was similar in the two models and is shown in Exhibit 10. The results of the models differ in the number of optimized groupings, the location of the cut-points and the size of derived groupings.

Staff prefers a more refined grouping structure as developed by the Kruskal Wallis model and recommends developing updated loss groupings using limited loss data and this methodology. Staff also recommends continuing to review the performance of the selected groupings to those based on the decision tree model to see which performs better over time.

### Kruskal-Wallis Bifurcation Illustration

Currently, five observations are used and classes are sorted by median development relativity.

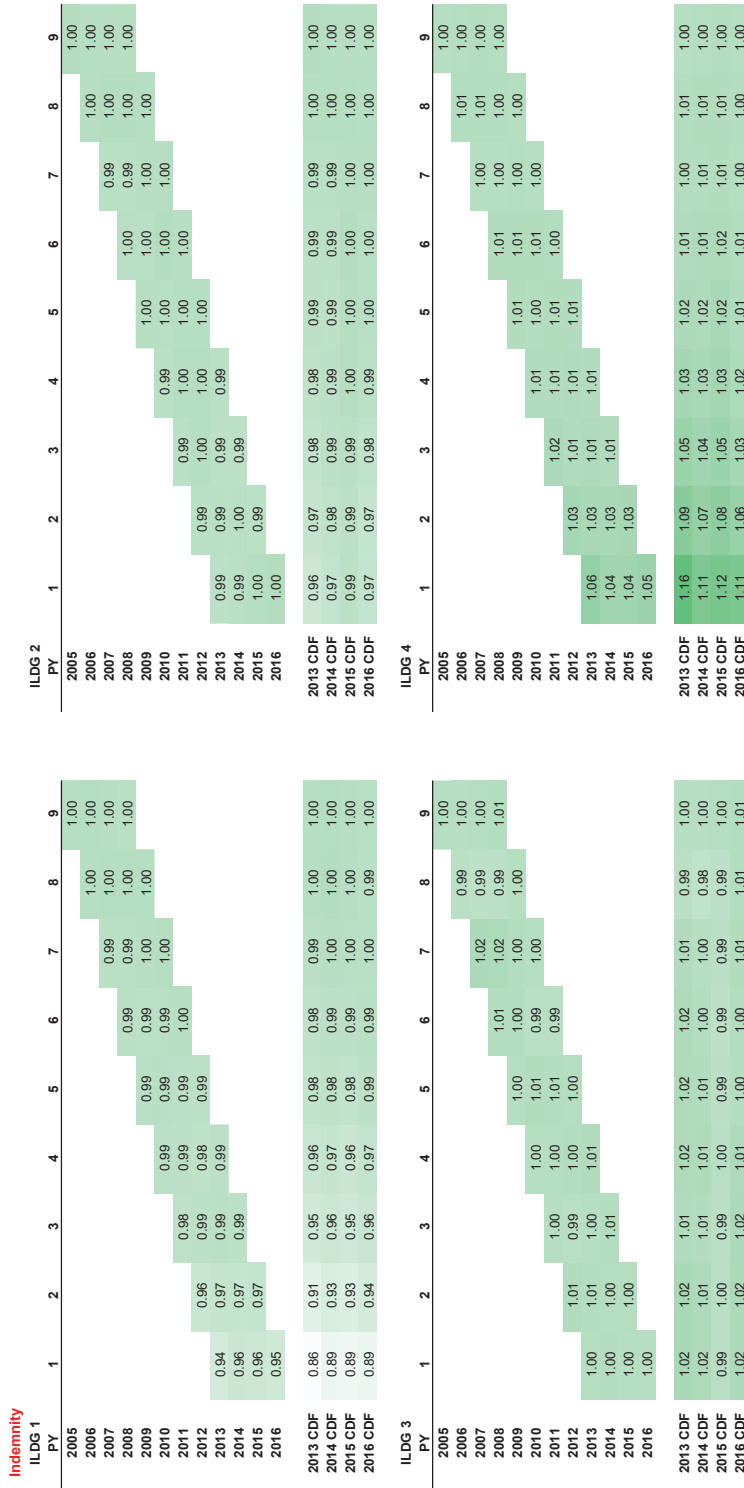

This example would separate classes into two groups {C, A} and {F, E, D, B}.

These two groups could be further bifurcated until there are too few observations or p-value is too high.

Class	Year	Relativity	<i>Sorted</i>		Avg. Rank		Test	Chi-Squared

## Variable Importance for Tree Models

\*Variable importance is calculated by the sum of the decrease in error when split by a variable. Then, the relative importance is the variable importance divided by the highest variable importance value so that values are bounded between 0 and 1.

## **Item AC20-12-04**

### **Experience Rating Eligibility**

The *California Workers' Compensation Experience Rating Plan—1995* (ERP) provides that the historical claim experience over the most recent three historical policies compared to the average expected for an employer of similar size and industry is used to compute an experience modification for the employer. The experience modification is applied to the premium paid by the employer for the upcoming policy. The objectives of the ERP are to promote workplace safety and help distribute the cost of the workers' compensation in a fair manner.

Not all California policyholders generate a sufficient volume of payroll and claims to produce a meaningful experience modification. As a result, the ERP provides that only employers who generate at least \$9,900 by applying their experience period payroll by classification to the current (as of January 1, 2021) approved expected loss rates are eligible for experience rating. Less than 20% of all policyholders are experience rated in California, but they generate almost 88% of statewide premium.

The experience rating eligibility threshold is adjusted for wage inflation annually. However, it has been many years since the WCIRB performed a comprehensive actuarial review of the level of the experience rating eligibility threshold and there have been significant changes to the structure of the ERP since then. Given this and that the principal objective of experience rating is to promote workplace safety, the WCIRB is undertaking a comprehensive review of the ERP eligibility threshold.

This review of experience rating eligibility is part of staff's multi-phase evaluation of experience rating. In the first phase of research, staff reviewed and proposed changes to the process used to update the expected loss ranges that determine each rated employer's primary threshold. During that process, staff determined that the methodology for credibility weighting classification D-ratios with hazard group D-ratios should be modified. Staff presented those changes to the Committee at the April 2, 2020 meeting. These refinements were reflected in the WCIRB's proposed experience rating values in the January 1, 2021 Regulatory Filing that were approved by the Insurance Commissioner on August 28, 2020.

#### **Study Approach**

In order to evaluate the effects of alternative rating structures, staff utilized unit statistical report (USR) loss and exposure records for policy projection years ranging from 1997 to 2017. Approximately 652,000 employers had experience in the projection year 2017 experience period. Of those 652,000 employers, 125,000, or 19%, were eligible for experience rating. Rated employers account for approximately 92% of expected losses. The ERP eligibility threshold in 2017 was \$10,100.

To update the primary thresholds earlier this year, staff constructed a database of employer experience for 38 cohorts by size totaling 150,000 employers per rating year. In order to evaluate scenarios for smaller employers, that database was extended to include 10 additional cohorts with 25,000 employers each, for a total of 400,000 employers with experience period expected losses down to approximately \$300.

The primary thresholds and D-ratios were optimized for this larger database using the same methodology underlying the primary threshold update in the January 1, 2021 Regulatory Filing. Staff found that the indicated primary thresholds continued to decrease smoothly, down to \$500 for the smallest employers included in the database. Exhibit 1 shows the fitted primary thresholds by cohort for policy projection year 2017.

#### **Predictive Power of Experience for Small Employers**

Staff began the review of the predictive power of past experience for small employers by examining the conditional distributions of projection period claim counts and loss ratios given experience period claim counts. These distributions are shown separately for currently ineligible employers and the smallest 55%

of currently rated employers in Exhibit 2.<sup>1</sup> Staff found that even for very small employers, the occurrence of claims in the experience period significantly increased the likelihood of claims in the projection period. In addition, the projection period loss ratio, defined as the ratio of actual to expected losses, was significantly higher for very small employers who had claims in the experience period than for those that did not.

Staff also reviewed predictive performance by loss cohort using quintiles tests. For each cohort, employers were grouped into quintiles by their experience modification with each quintile in a cohort containing an equal number of employers. For each quintile, the projection period loss ratio and modified projection period loss ratio were calculated. Based on these tests, it was found that experience modifications calculated using the current formula and methodology are at least somewhat predictive of projection period loss ratios for employers with experience period expected losses above approximately \$1,000 for policy projection year 2017. For employers with expected losses below \$1,000, the projection period loss ratios by modification quintile did not increase monotonically with the number of claims. For employers with expected losses above this threshold, the projection period loss ratios almost always increased monotonically, and the variance ratio<sup>2</sup> was almost always below 60%. Exhibit 3 shows the variance ratios by cohort for select cohorts.

### Consideration of Five-Year Experience Period

While experience rating is predictive for employers below the current eligibility threshold, concern remains that modifications for smaller employers could be less stable from year to year. Currently, the experience modification is calculated based on three years of experience. It was suggested that lengthening the experience period from three years to five years might help stabilize the modifications and better predict projection period loss ratios, especially for smaller employers.

Staff optimized the primary thresholds and D-ratios for a five-year experience period and reviewed plan performance. It was found that a five-year experience period did not add significant predictive power to the ERP and in many cases led to worse performance. This may be due to changing risk parameters over time, changing safety practices, and generally less predictive power in older data. It was also pointed out that using a five-year experience period would imply that a claim would affect the modification for five years instead of three years, which could be perceived by stakeholders as overly punitive. Based on this and the increased administrative costs of implementing a five-year experience period, staff does not recommend any changes to the length of the experience period. Exhibit 4.1 shows the quintiles test variance ratios by cohort using a three- and five-year experience period. Exhibit 4.2 shows the efficiency<sup>3</sup> by cohort.

### Claim Count Based Caps

The current ERP provides for variable split points that give 100% credibility to actual primary losses and 0% credibility to actual excess losses. The ERP also provides that the impact of a single claim during the experience period is limited to 25 percentage points. Going beyond the single claim limitation in the current ERP, since each claim is limited to the primary threshold less \$250, there is a maximum impact to the experience modification from a single claim relative to expected losses. This is calculated as  $(S - 250)/E$  where  $S$  is the primary threshold and  $E$  is the experience period expected losses. Since the primary threshold is a function of expected losses, this implied cap can be calculated given  $E$ . Exhibit 5 shows the implied caps as a function of  $E$  under the current ERP. Note that as expected the implied cap decreases as  $E$  increases. For the largest employers, the maximum impact of a single claim is very small relative to expected losses, while for the smallest employers, it is quite large.

---

<sup>1</sup> For the purposes of this analysis, in accordance with the current rules of the ERP, the first \$250 of losses were excluded from each claim and claims with \$250 or less of incurred losses were excluded when determining claim counts.

<sup>2</sup> The variance ratio is defined as the ratio of the variance of the modified loss ratio to the variance of the unmodified loss ratio.

<sup>3</sup> Efficiency is measured as the reduction in squared error between any potential experience modification and loss ratios for the projection year, measured against a modification of 100%. Efficiencies are calculated by cohort, with each observation contributing equal weight.

The differential impact by size of expected losses suggests a benefit from capping experience modifications by claim counts for small employers. Since large employers are already covered by the implied caps, a claim count based capping system would protect small employers from large swings in their experience modifications without affecting larger employers. Capping based on claim counts would also allow a higher experience modification for an employer with many claims, while limiting the modifications for employers who only had one or a few claims. (The New York Compensation Insurance Rating Board is considering proposing a plan with claim count based caps.)

Exhibit 6 shows proposed caps on experience modifications by claim count. Staff's suggested caps were selected by reviewing the average experience modification for employers with 0, 1, 2, 3 and 4 or more claims, and by considering the implied caps for currently eligible employers. Staff selected the caps to be slightly higher than the average experience modification for the smallest currently eligible employers with the given number of claims. For example, the proposed cap of 1.5 for employers with 2 claims was selected to be slightly higher than the average modification of 1.48 for employers with \$5,000 to \$10,000 of experience period expected losses and the same number of claims.<sup>4</sup>

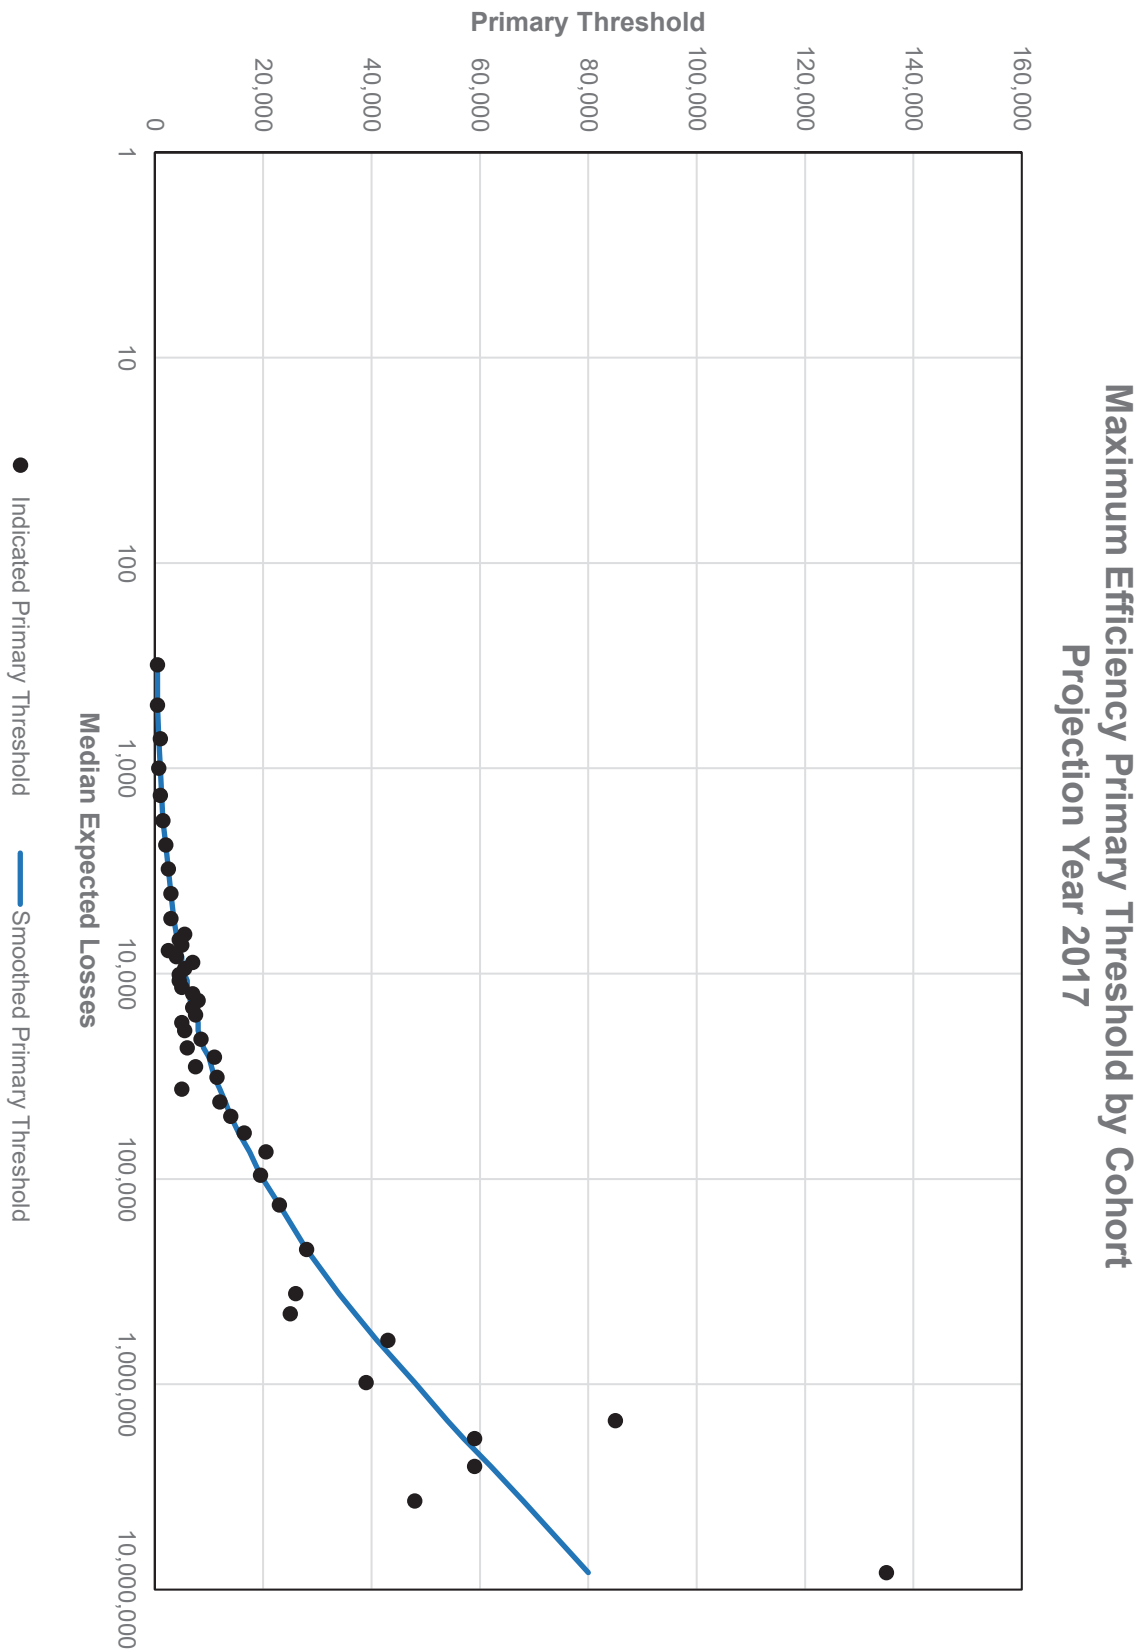

For claim-free employers, staff judgmentally suggested a cap of 0.95. This was done to ensure that all claim-free employers would get at least a 5% credit as part of the incentive for safety. This would primarily impact small employers where the primary threshold is low and nearly all of the expected losses are in the excess layer. If the eligibility threshold is set at \$1,000 or greater, the impact would be small, an approximately 0.2 percentage point decrease in the average mod for employers with \$1,000 to \$3,500 in experience period expected losses. The largest employer that would have been impacted by this in policy year 2017 had approximately \$3,500 in expected losses.

Exhibit 7.1 shows the average impact of capping by cohort. As can be seen, capping has no impact on large employers due to the implied cap. Even for small employers, the average impact is modest. With all cohorts included, the impact is an approximately 0.001 decrease to the weighted average experience modification. Exhibit 7.2 shows the average impacts of capping by industry sector. Capping has the greatest impact on the Outside Sales and Clerical sectors, but the differences among impacts by industry sector are relatively modest.

Staff believes that lowering the experience rating eligibility threshold would help to incentivize safety for smaller employers. Past experience is predictive of future losses for employers well below the current eligibility threshold. There is concern, however, that small employers could suffer significant swings in premium from year to year if they were to become experience rated. Claim count based caps provide a promising way to protect small employers from the impact of these swings. Staff would like to solicit feedback from the Committee regarding the appropriateness of lowering the eligibility threshold, of implementing claim count based caps on experience modifications, and of the methodology used to select the caps.

---

<sup>4</sup> These claim counts exclude losses below the \$250 first aid threshold.

Median E and Primary Threshold based on 5-year experience period.

The implied cap is  $(\text{Primary Threshold} - 250) / E$ .  
This is the incremental change in mod due to a claim that meets or exceeds the primary threshold.  
Source: 2020 ERP.

## **Item AC20-12-05**

### **Special Data Call for COVID-19 Claims**

At the September 8, 2020 meeting, the Committee discussed the topic of collecting additional aggregate financial information on COVID-19 claims. After reviewing this issue further which included a review of the data being collected in other jurisdictions, staff believes the COVID-19 claim data would be valuable in tracking COVID-19 claims in consideration of the September 1, 2021 Pure Premium Rate Filing as well as for validating COVID-19 claim information being reported in the WCIRB's transactional data. Staff plans to issue a supplemental call for accident year 2020 COVID-19 claims valued as of December 31, 2020 to be due in February 2021. The supplemental data call will request information on losses, claim counts and paid ALAE similar to what is requested in the WCIRB's Quarterly Call. Attached is a draft copy of the supplemental data call.

In the California Department of Insurance (CDI) Decision on the January 1, 2021 Pure Premium Rate Filing, the CDI directed the WCIRB to collect "data of aggregate premium charged for any rate component and/or rating plan that includes an adjustment for COVID-19." At the meeting, staff will discuss the process for collecting this data with the Committee.

**WCIRB Special Call for COVID-19 Claim Data Evaluated as of December 31, 2020**

Data Page

Accident Year	Indemnity		Medical		Paid ALAE (7)	Open Indemnity Claim Counts (11)	Total Indemnity Claim Counts (12)	Total Claim Counts (13)	Reporting Entity Code
	Paid Losses (1)	Loss Reserves Excluding IBNR (2)	Paid Losses (3)	Loss Reserves Excluding IBNR (4)					
2020									998

Note: All data is only for claims occurring in 2020 and arising out of a diagnosis of COVID-19 (Catastrophe Code 12). For convenience, the column numbers correspond to the column numbers of the related columns on the Accident Year Exhibit of the CA-QT-4Q20 Quarterly Call.

Actuarial Committee  
Meeting Agenda for December 8, 2020

**WCIRB Special Call for COVID-19 Claim Data Evaluated as of December 31, 2020**

Instructions

**Information reported must be in accordance with the following:**

Note: These instructions are consistent with those included in the WCIRB's Quarterly Call for Experience.

- (a) All data is only for claims arising out of a diagnosis of COVID-19 (Catastrophe Code 12) in which the accident occurred in 2020 (accident year 2020) valued as of December 31, 2020.
- (b) Paid data for each accident year must be reported on a "cumulative" basis. This means that the total of all amounts paid on each COVID-19 claim belonging to accident year 2020 from the time the claim is reported to December 31, 2020 must be included.
- (c) Reserves valued as of December 31, 2020 must be reported. Voluntary reserves must be excluded.
- (d) Indemnity losses (paid, reserves excluding IBNR) must be reported in accordance with the definition of "Indemnity Losses" in Part 4, Section II of the USRP, available on the WCIRB website at <http://www.wcirb.com/document/123>.
- (e) Medical losses (paid, reserves excluding IBNR) must be reported in accordance with the definition of "Medical Losses" in Part 4, Section II of the USRP, available on the WCIRB website at <http://www.wcirb.com/document/123>.
- (f) Paid ALAE must be reported in accordance with the definition of "Allocated Loss Adjustment Expenses" in Part 4, Section II of the USRP, available on the WCIRB website at <http://www.wcirb.com/document/123>. Please note that claims that contain Paid ALAE but do not have any indemnity or medical incurred value must have their Paid ALAE value reported, however they must not be included in reported claim counts.
- (g) Claim count data must be reported on a cumulative basis. This means that the total number of claims belonging to accident year 2020 as of December 31, 2020 must be included. Reopened claims must not be counted as a separate claim from the original claim.
- (h) "Indemnity claims" means claims with indemnity incurred (paid plus case reserves) greater than zero as of December 31, 2020.
- (i) "Medical-only claims" means claims with medical incurred (paid plus case reserves) greater than zero and indemnity incurred equal to zero as of December 31, 2020.
- (j) "Open claims" refers to claims which have not had a final loss payment made as of December 31, 2020 (irrespective of future ALAE payments to be made).
- (k) Column data must conform to the following table:

Col.	Field Name	Description
1	Paid Losses (Indemnity)	Report cumulative indemnity amount paid for each accident year 2020 as of the evaluation date of the call December 31, 2020.
2	Loss Reserves Excluding IBNR (Indemnity)	Report indemnity reserves (excluding IBNR) for each accident year 2020 as of the evaluation date of the call December 31, 2020. <u>Include:</u> <ul style="list-style-type: none"> <li>• Indemnity case reserves</li> <li>• Indemnity reserve for reopened claims</li> </ul> <u>Exclude:</u> <ul style="list-style-type: none"> <li>• Indemnity reserves for incurred but not reported claims</li> <li>• Voluntary reserves</li> </ul>
3	Paid Losses (Medical)	Report cumulative medical amount paid for each accident year 2020 as of the evaluation date of the call December 31, 2020. For claims covered by policies incepting <b>prior to</b> July 1, 2010 only, include the cumulative paid cost of medical cost containment programs (MCCP) that are not related to Independent Bill Review (IBR) and Independent Medical Review (IMR).
4	Loss Reserves Excluding IBNR (Medical)	Report medical reserves for each accident year 2020 as of the evaluation date of the call December 31, 2020. <u>Include:</u> <ul style="list-style-type: none"> <li>• Medical case reserves</li> <li>• Medical reserve for reopened claims</li> </ul> <u>Exclude:</u> <ul style="list-style-type: none"> <li>• Medical reserves for incurred but not reported claims</li> <li>• Voluntary reserves</li> </ul>
7	Paid ALAE	Report cumulative ALAE (including medical cost containment program costs of IBR and IMR) amount paid for each accident year 2020 as of the evaluation date of the call December 31, 2020. For claims covered by policies incepting <b>on or after</b> July 1, 2010 only, also include the cumulative paid cost of MCCP that are not related to IBR and IMR.
11	Open Indemnity Claim Counts	For each of the accident years 1989 and forward, report the number of indemnity claims (i) which were open as of the evaluation date of the call December 31, 2020 and (ii) where the sum of indemnity cumulative loss paid and indemnity loss case reserve for each claim as of the evaluation date of the call is greater than zero.
12	Total Indemnity Claim Counts	For each of the accident years 1989 and forward, report the cumulative total number of indemnity claims (both open and closed) as of the evaluation date of the call December 31, 2020, where the sum of indemnity cumulative loss paid and indemnity loss case reserve for each claim as of the evaluation date of the call December 31, 2020 is greater than zero.
13	Total Claim Counts	For each of the accident years 1989 and forward, report the cumulative total number of indemnity and medical-only claims (both open and closed) as of the evaluation date of the call December 31, 2020, where the sum of indemnity and medical cumulative loss paid and indemnity and medical loss case reserves for each claim as of the evaluation date of the call December 31, 2020 is greater than zero.

## **Item AC20-12-06**

### **Potential Applications of Indemnity Transaction Data**

At the December 12, 2018 meeting, in part in response to an Insurance Commissioner directive, the Governing Committee authorized the collection of indemnity transaction data in accordance with the requirements reflected in the Workers' Compensation Information System (WCIS) by which the Division of Workers' Compensation (DWC) has been collecting transactions for a number of years. (The WCIRB had been collecting this data on a voluntary basis from a small number of insurers since 2017.) In response, the WCIRB began the collection of indemnity transaction data for all insurers writing more than 1% of pure premium statewide with transactions as of April 1, 2020 and has already begun using the data to help understand the impact of the COVID-19 pandemic and resulting economic downturn. Data is reported on a daily, weekly or monthly basis and is expected to be the first information received by the WCIRB on individual claims. Staff anticipates that this data will greatly enhance our ratemaking and research capabilities via more granular and timely data.

#### Drill Downs from Aggregate Financial Data

Staff plans to expand our capacity to drill down from the aggregate financial data reported quarterly by building comparisons between the aggregate financial data and the indemnity transaction data. This would expand our ability to understand the dynamics of temporary disability (TD) and permanent disability (PD) payments including differences in the timing of payments, changes in the number of weeks of paid TD and changes in estimated PD rating. This would also provide the ability to better understand drivers of changes in the data such as industry characteristics well before unit statistical data is reports (USRs) on the claim are received. Staff plans to explore potential drill downs based on information such as claim status, industry, classification code, location and litigation status.

#### Emerging Claim Types

The contemporaneous nature of indemnity transaction data will allow us to identify and assess rapidly emerging claim types. For example, within a few weeks of the COVID-19 pandemic emerging we were able to identify the relative volume of emerging COVID-19 claims using this data. At the same time, we were able to begin use reported data on these claims to analyze the characteristics of these COVID-19 claims such as classification, age of worker and denial rates.

#### More Refined Triangles

Staff plans to explore additional claim characteristic triangles to review. These may include monthly or quarterly triangles for metrics such as claim counts, paid indemnity and settlement rates. This may also include more refined versions of triangles along dimensions such as region, litigation status and part/nature/cause.

#### Claim Level Analysis before Unit Stat Reporting

The indemnity transaction data will allow us to view the component payment streams of each claim reported. It will also provide information about medical settlements to combine with the medical transaction data to provide a more complete view of the loss payments on a claim. We will also be able to identify litigated claims and analyze what other characteristics are associated with litigation. The data set provides more detailed information on claims status as claims are identified as re-opened/re-closed in addition to open/closed and information on return to work.

In particular, continuous trauma (CT) claims are a significant cost component in California workers' compensation and have been found to be highly correlated with changes in indemnity claim frequency. Staff plans to build tracking exhibits to help identify changes in reporting and overall levels of CT claims earlier than when they become available via reported USRs.

#### Merging Medical and Indemnity Transaction Data

Currently, insurers are required to report transaction data if their written pure premium volume exceeds 1% of the statewide insured market and are required to continue reporting even if their volume falls below 1%.<sup>1</sup> Staff checks the volume, robustness and suitability of this data for ratemaking and research purposes. Staff is planning to improve the quality of the checks for completeness of the data for ratemaking and research by comparing claim counts and matching claims between the indemnity and medical transaction data sets. Ultimately, staff plans to merge data by claim to facilitate analyses of claim development by claim characteristic as well as the ability to view claim level data both earlier and more frequently than possible with unit statistical data. Staff plans to test the ability to combine the two datasets to provide a complete drill down from the unit statistical data.

#### Improving our Geolocation Protocols for Claims and Exposure

Several years ago, staff developed geolocation protocols for USR claims and exposure data. The geolocated data is used for the WCIRB's annual Geo Studies as well as many other studies for which we wish to incorporate region into the analysis. Our current geolocation protocol for claims relies on the billing zip codes from the medical transaction data to estimate a center of medical services. The First Report of Injury (FROI) record includes the employer location, the zip code for the injury site, and the zip code for the employee. Staff plans to explore how to combine the data elements from both data sets in order to optimize our geolocation protocol for claims.

Our current exposure location protocol relies on the locations on the policy and the number of employees by location within the D&B Hoovers data. Staff plans to cross check the zip codes for the injury sites with the locations on the policy and in the D&B Hoovers data in order to improve our understanding of what locations are on each policy and where exposures are located.

#### Analyzing Claim Frequency Changes

The timeliness of indemnity transaction data will allow us to use the information to supplement our analyses of claim frequency data. For example, in 2020, staff has developed exhibits to measure changes in claim filing patterns due to the pandemic-related economic downturns. Staff also plans to review the use of indemnity transaction data in its comprehensive review of the WCIRB's claim frequency projection model that is planned for 2021.

#### Industry Benchmarking

In 2019, staff developed and released a set of benchmarking reports to insurers who participated in the voluntary indemnity data call. In 2020, staff is developing an enhanced version of these reports for participants in the mandatory data call with release planned in early 2021. Staff plans to present a webinar to recipients soon after the first set of reports are released and plans to develop additional benchmarking exhibits later in 2021.

#### Reconciling Across Data Sets

Validation of data is an important first step before any analytic project. Staff plans to use this dataset to help inform our internal data validation processes and reasonability checks.

---

<sup>1</sup> Staff is proposing changing the threshold for required transaction data reporting from 1% to 0.5%. See Agenda Item AC20-12-08.

## Item AC20-12-07

### Potential 2021 Actuarial and Research Projects

Potential actuarial and medical research studies under consideration for 2021 are shown below. Also shown for each potential study is staff's assessment of the current status of the study. Committee input is being solicited as to the completeness and relative priority of these potential studies.

#### A. Studies Arising Out of California Department of Insurance (CDI) Directives and Decisions

1. Indemnity Claim Frequency Model Projections. In the CDI Decision on the January 1, 2017 Pure Premium Rate Filing, the CDI recommended that the WCIRB review its frequency projection model in light of the continued increases in indemnity claim frequency.

**Project Status:** The WCIRB regularly reviews its frequency projection model and has made a number of enhancements over the years. Staff anticipates conducting a comprehensive study of the frequency projection model in 2021 with a report containing recommended methodology enhancements provided to the Actuarial Committee by the fourth quarter of 2021.

2. Terrorism Data Reporting. The CDI has directed staff to provide information to both the National Association of Insurance Commissioners (NAIC) and the Federal Insurance Office (FIO) related to terrorism exposure in California workers' compensation.

**Project Status:** Staff anticipates providing the annual updates to the NAIC and FIO in the first and second quarters of 2021.

3. Potential Adjustments to Allocated Loss Adjustment Expense (ALAE) Projections. In the CDI Decision on the January 1, 2019 Pure Premium Rate Filing, the CDI recommended that the WCIRB review the ALAE projection methodology in light of accelerating claim settlement rates. In the CDI Decision on the January 1, 2021 Pure Premium Rate Filing, the CDI noted that despite adjustments for changing claim settlement, there is continued downward development in ALAE and recommended that the WCIRB further study the underlying causes.

**Project Status:** Staff completed an analysis of potential adjustments to the ALAE projection methodology that was accepted by the Actuarial Committee at the August 1, 2019 meeting and reflected in the January 1, 2020 Pure Premium Rate Filing. Staff completed a follow-up analysis with enhanced methodology adjustments that was accepted by the Actuarial Committee at the August 4, 2020 meeting and reflected in the January 1, 2021 Pure Premium Rate Filing. In light of the concerns discussed in the recent CDI Decision, staff anticipates further reviewing ALAE development methods with the Actuarial Committee in consideration of the September 1, 2021 Pure Premium Rate Filing by the second quarter of 2021.

4. Adjustments to Loss Development for Reduced Lien Filings. In the CDI Decision on the January 1, 2019 Pure Premium Rate Filing, based on recently available lien filing information, the CDI predicated the approved January 1, 2019 pure premium rates on an assumed 50% reduction in lien filings rather than the 40% reflected in the WCIRB's Filing. The CDI also recommended that the WCIRB review the adjustment based on the most recent lien information available. In the CDI Decision on the January 1, 2021 Pure Premium Rate Filing, the CDI recommended that, given that there has been continued reduction in lien filings, further study is needed with respect to the impact of the lien reduction on both loss and ALAE development.

**Project Status:** Staff completed an analysis of adjustments to loss development and ALAE development to reflect reduced lien filings that was reflected in the January 1, 2020 and January 1, 2021 Pure Premium Rate Filings. Staff anticipates reviewing these adjustments in light of the concerns discussed in the recent CDI Decision with the Actuarial Committee in consideration of the September 1, 2021 Pure Premium Rate Filing by the second quarter of 2021.

5. Collection of Indemnity Transaction Data. In December 2018, the Insurance Commissioner directed the WCIRB to begin the collection of indemnity transaction data in accordance with the requirements reflected in the Workers' Compensation Information System (WCIS).

**Project Status:** Indemnity transaction data is being submitted and processed by all required insurers in accordance with the schedule established by the Governing Committee. A report on the potential ratemaking and research uses of this data is being presented to the Actuarial Committee at the December 8, 2020 meeting (Item AC20-12-06).

6. Collection of COVID-19 Premium Data. In the CDI Decision on the January 1, 2021 Pure Premium Rate Filing, the Insurance Commissioner directed the WCIRB to collect information on insurer premium charges related to COVID-19.

**Project Status:** Staff will discuss potential changes to WCIRB aggregate data calls to collect information on insurer premium charges related to COVID-19 at the December 8, 2020 Actuarial Committee meeting (Item AC20-12-05).

## **B. Studies/Projects Directed by Legislation**

1. Statewide Paid Costs. Section 11759.1 of the Insurance Code requires the WCIRB to report annually on workers' compensation costs paid during the preceding calendar year. The 2020 calendar year report is required to be completed by June 2021.

**Project Status:** Staff anticipates publishing the required report by the end of the second quarter of 2021. In addition, as in the last several years, staff anticipates compiling information from this report and other WCIRB reports into a high level "executive summary" of the state of the California workers' compensation system to be published by the third quarter of 2021.

2. Policyholder Dividends. Section 11739 of the Insurance Code requires the WCIRB to collect information on policyholder dividends in California and prepare an annual report to the Insurance Commissioner.

**Project Status:** Staff anticipates providing the report on 2020 dividends to the CDI by the third quarter of 2021.

3. Report on Roofing Industry. Section 11665 of the Insurance Code requires the WCIRB to annually compile and report the payroll and loss data reported in the roofing classification for employers holding C-39 licenses from the Contractors State License Board as well as the payroll and loss information by employer payroll size interval.

**Project Status:** Staff anticipates providing this report to the CDI in the second quarter of 2021.

## **C. COVID-19 Pandemic Related Research**

1. Cost of COVID-19 Claims. On April 8, 2020, the WCIRB was requested by the Assembly Insurance Committee to provide a cost estimate of a potential conclusive presumption of

compensability of COVID-19 claims applied to “essential” workers. On May 6, 2020, Governor Newsom issued an Executive Order providing for a rebuttable presumption of compensability for COVID-19 claims to apply from March 19, 2020 to July 5, 2020 to all workers directed to work outside the home. Senate Bill No.1159 (SB 1159) was signed into law in September 17, 2020 codifying the Governor’s Executive Order and establishing another COVID-19 presumption of compensability once the Governor’s Executive Order expired.

**Project Status:** On April 17, 2020, the WCIRB provided the Assembly Insurance Committee a cost evaluation of a potential COVID-19 conclusive presumption of compensability. On May 22, 2020, the WCIRB published a cost evaluation of the Governor’s Executive Order. The WCIRB’s Amended January 1, 2021 Pure Premium Rate Filing submitted on September 15, 2020 included an evaluation of the cost impact on COVID-19 claims on 2021 policies that contemplated the impact of SB 1159. Staff anticipates updating the cost evaluation of COVID-19 claims as part of the September 1, 2021 Pure Premium Rate Filing in the second quarter of 2021.

2. Impact of Pandemic-Related Recession on Claim Frequency. Unemployment in California has skyrocketed with the pandemic and resultant stay-at-home orders resulting in many business slowdowns and closures. Historically, frequency has generally declined during recessions. However, with the suddenness and magnitude of the drop in employment, recent trends in cumulative trauma claims and post-termination claims and potential waves of COVID-19 claims, the overall impact on claim frequency is not clear.

**Project Status:** On June 1, 2020, the WCIRB published a research brief on the impact of economic downturns on indemnity claim frequency. The brief summarized the historical impact of prior economic downturns on claim frequency, WCIRB model projections of the range of potential impacts of the current downturn, and the potential impacts of cumulative trauma, post-termination and COVID-19 claims. Staff anticipates continuing to report on these key frequency measures regularly through 2021.

3. COVID-19 Early Claim Cost Indicators. The COVID-19 pandemic and resultant stay-at-home orders are expected to have a major impact on accident year 2020 emerging costs as well as the loss development of earlier accident years. Among the areas potentially impacted include claim frequency, medical treatment levels, COVID-19 diagnosis claims, claim settlement rates, litigation rates, cumulative trauma claims, post-termination claims and temporary disability duration.

**Project Status:** The WCIRB initiated a COVID-19 cost monitoring process using transactional indemnity data, medical transactional data, information from the Division of Workers’ Compensation (DWC), special surveys as needed and other information to develop early indicators of experience emerging during the pandemic. Staff provided summaries of this information to the Actuarial Committee at several 2020 Committee meetings. Staff anticipates further regular updates to this information in 2021.

4. COVID-19 Early Exposure and Premium Indicators. The COVID-19 pandemic and resultant stay-at-home orders will have a major impact on calendar year 2020 and later exposure and premium. In addition to the impact of employment reductions by sector, the temporary reassignment to the clerical classification of employees temporarily performing clerical duties at home, the continuation of pay to employees not working and return premium on expiring 2019 and early 2020 policies will significantly impact calendar year 2020 and later premiums.

**Project Status:** Staff has undertaken a survey of employers with over 1,500 employer responses thus far to help quantify the impact of the pandemic on premium levels due to staff and work hour reductions, furloughs and reassignment of workers to clerical duties. Staff is also preparing summaries of quarterly premiums by policy year. Staff anticipates presenting this information to the Actuarial Committee in the first quarter of 2021 in

**consideration as to whether any premium adjustment for calendar year 2020 may be appropriate in the September 1, 2021 Pure Premium Rate Filing.**

5. Impact of Medical Treatment Delays. With the COVID-19 pandemic and resultant stay-at-home orders, a significant level of medical treatment that would otherwise have been provided was delayed or foregone completely. At the April 2, 2020 meeting, the Actuarial Committee discussed that, with these potential delays or avoidance of medical treatments early in the life of a claim, future medical costs and return-to-work may be impacted.

**Project Status: On October 30, 2020, the WCIRB released a research report on the impact of delayed medical treatment on future medical treatment and outcomes. Staff anticipates presenting an analysis as to whether any additional adjustment to the loss development projections in the September 1, 2021 Pure Premium Rate Filing are appropriate given the delays in medical treatment in the early weeks of the pandemic in the first quarter of 2021.**

6. COVID-19 Claim Severity. There is significant information available on the number of COVID-19 claims. However, given how recently these claim have occurred, the nature of the more severe claims and typical reporting lags in the reporting of hospital payments, there is limited information on the cost and treatment pattern of the more severe COVID-19 claims. In WCIRB cost evaluations published in 2020, many of the severity assumptions were predicated on the cost and treatment patterns of similar claims as well as expert medical and claims opinion.

**Project Status: Staff anticipates preparing an analysis of the cost and treatment patterns of severe COVID-19 claims for the Actuarial Committee's review in the fourth quarter of 2021 based on data from both the workers' compensation system and data from the group health system.**

7. Increased Usage of Telemedicine. With the COVID-19 pandemic and resultant stay-at-home orders, the use of telemedicine in workers' compensation is increasing. In recent months, the DWC has adopted a number of changes to fee schedules to address telemedicine.

**Project Status: In 2020, staff has presented regular summaries of costs reported in telemedicine codes to the Actuarial Committee. Staff anticipates continuing to provide regular updates on telemedicine costs in 2021. Based on this information, the Committee can consider in the latter part of 2021 whether an in-depth study of telemedicine is appropriate in 2022.**

8. Increase in Telecommuting. With the COVID-19 pandemic and resultant stay-at-home orders, many employees have begun working from home and a significant level of telecommuting is likely to continue even after stay-at-home orders expire.

**Project Status: A new classification for telecommuting was proposed by the WCIRB and adopted by the Insurance Commissioner effective January 1, 2021. At the August 4, 2020 Actuarial Committee and August 7, 2020 Classification and Rating (C & R) Committee meetings, the consensus of the committees was that the advisory pure premium rate for the new classification be proposed to be initially equal to that for the clerical classification. Both committees also recommended that preliminary experience emerging in the new classification in 2021 be reviewed in late 2021 to assess whether there is a significant differential in experience between the new classification and the clerical classification. Staff anticipates presenting a preliminary analysis of emerging experience in the new classification for telecommuting to the Actuarial Committee and the C & R Committee by the fourth quarter of 2021.**

#### **D. Cost Impact of Legislative and Regulatory Changes**

1. Senate Bill No. 863 (SB 863) Cost Monitoring. SB 863 was enacted in 2012 and included a number of reform provisions related to the California benefit delivery system. In March 2013, the WCIRB submitted a comprehensive plan to the CDI to monitor the emerging costs related to SB 863.

**Project Status:** The WCIRB's fourth and final comprehensive retrospective cost evaluation of SB 863 was published on November 17, 2016. In October 2019, the WCIRB published a research brief providing an updated retrospective evaluation of several components of SB 863 for which updated data was available. Staff does not anticipate further analyses as to the overall cost impacts of SB 863.

2. Additional Fee Schedules. SB 863 provides for new fee schedules for interpreter and home health services to be promulgated. In addition, the DWC is contemplating changes to the medical-legal fee schedule.

**Project Status:** At this time, the DWC has not promulgated final schedules for interpreter, home health or medical-legal services. If any of those fee schedules are finalized, working with the Claims Working Group, Medical Analytics Working Group and Actuarial Committee, staff anticipates completing its analysis of the pure premium rate impact of the new fee schedules within 120 days of the final values being promulgated.

3. Drug Formulary. Pursuant to Assembly Bill No. 1124, the DWC adopted a new drug formulary to be effective January 1, 2018.

**Project Status:** The WCIRB's prospective evaluation of the new drug formulary was completed in the first quarter of 2018 and reflected in the July 1, 2018 and subsequent premium rate filings. In August 2019, the WCIRB published an initial retrospective analysis of the impact of the drug formulary. Staff has updated the analysis based on additional post-drug formulary experience through early 2020 for presentation to the Actuarial Committee at the December 8, 2020 meeting (Item AC17-12-02) with a research brief to be published in the first quarter of 2021. No further analysis of the formulary is contemplated for 2021.

4. Senate Bill No. 1160 (SB 1160) Restrictions on Utilization Review. SB 1160 was signed into law on September 30, 2016. Primarily, SB 1160 restricts utilization review within the first 30 days of treatment on injuries occurring on or after January 1, 2018. The WCIRB's cost evaluation of SB 1160 as approved by the Actuarial Committee at the September 6, 2016 meeting was reflected in the WCIRB's Amended January 1, 2017 Pure Premium Rate Filing as well as subsequent pure premium rate filings.

**Project Status:** A preliminary retrospective analysis of the SB 1160 restriction on utilization review within 30 days of the injury was reviewed by the Actuarial Committee at the August 1, 2019 meeting and reflected in the January 1, 2020 Pure Premium Rate Filing. Staff anticipates updating this analysis based on an additional post-SB 1160 experience by the second quarter of 2021.

5. Impact of the Geographic Practice Cost Index (GPCI) on Physician Fees. The DWC adopted the Medicare GPCI, effective January 1, 2019, to replace the statewide geographic adjustment factor (GAF) as Medicare's MSA-based locality-specific GAF. This GPCI varies fee schedule amounts for various physician services based on the location of the provider.

**Project Status:** A prospective analysis of the cost impact of the new GPCI factors was reviewed by the Actuarial Committee at the April 2, 2019 meeting. Staff anticipates

**updating this analysis based on additional post-GPCI experience by the third quarter of 2021.**

**E. Other Studies Directly Impacting Pure Premium Rates and Rate Level Projections**

1. Classification Ratemaking Methodologies. Although the WCIRB has reflected refinements to the classification ratemaking loss development process in 2012 as well as adjustments for differences in wage levels by classification in 2016, a comprehensive review of the classification ratemaking methodologies has not been undertaken for a number of years.

**Project Status: Staff has completed a comprehensive study of loss development as the first phase of a multi-year comprehensive study of classification ratemaking methodologies with the results being presented to the Actuarial Committee at the December 8, 2020 meeting (Item AC20-12-03). Staff anticipates beginning the second phase of the analysis related to premium on-leveling adjustments with a report to be presented to the Actuarial Committee by the fourth quarter of 2021.**

2. Study of Dual Wage Thresholds. In 2017, the C & R Committee recommended that a comprehensive study of the dual wage classification thresholds be conducted every two years.

**Project Status: The last comprehensive study of dual wage thresholds was completed in 2019 and reflected in the January 1, 2020 Regulatory Filing. Staff anticipates completing a comprehensive study for the C & R Committee's review by the fourth quarter of 2021 in preparation for the September 1, 2022 Regulatory Filing.**

3. Payroll Limitations for Classification Ratemaking. At the March 21, 2017 meeting, the Actuarial Committee noted that total costs per \$100 of payroll declined at higher wage levels. Given this, it was noted that staff planned to explore expanding the number of classifications subject to an employee annual payroll limitation.

**Project Status: In the January 1, 2019 Regulatory Filing, the CDI approved the WCIRB's proposal to limit an employee's payroll to the amount used to limit the payroll of executive officers for five classifications effective on January 1, 2020 and later policies. Pure premium rates for these classifications that reflect adjustment for the impacts of the limitations on payroll were adopted by the Insurance Commissioner in the Decision on the January 1, 2020 Pure Premium Rate Filing. Additional classifications for which limitations are appropriate were approved by the C & R Committee in the first quarter of 2020 to be included in the September 1, 2021 Pure Premium Rate Filing to be submitted in the first quarter of 2021 with the limitations proposed to be effective September 1, 2022.**

4. Pharmaceutical Cost Reductions. At the August 1, 2018 meeting, the Actuarial Committee noted that with the sharp reductions in pharmaceutical costs and that the pharmaceutical share of medical payments varies significantly by maturity level, medical loss development could be affected. As a result, the Committee recommended that the WCIRB undertake an analysis of the impact of the recent reduction in pharmaceutical costs on medical loss development.

**Project Status: The Committee reviewed an analysis of the impact of pharmaceutical cost reductions on loss development at the June 14, 2019 meeting and the WCIRB reflected an adjustment to the loss development methodology in the January 1, 2020 and January 1, 2021 Pure Premium Rate Filings. Staff anticipates reviewing the adjustment factors based on updated data on pharmaceutical costs with the Actuarial Committee in the fourth quarter of 2021.**

5. Review of ULAE Projection Methodologies. As discussed at the August 1, 2018 Actuarial Committee meeting, while the WCIRB has continued to modify the data collected related to ULAE in order to enhance the accuracy of the ULAE projection, a comprehensive review of the ULAE projection methodologies has not been undertaken for some time.

**Project Status: The Actuarial Committee reviewed an initial analysis of ULAE projection methodologies at the December 5, 2019 meeting. Staff is presenting an updated analysis of ULAE methodologies for the Committee's review at the December 8, 2020 meeting (Item AC19-12-02).**

6. Nine-Month Loss Projections. At the December 5, 2019 meeting, with the transition of the WCIRB's filing schedule to a September 1 effective date, the Actuarial Committee recommended reviewing the accuracy of accident year experience valued as of September 30 as the basis of projecting December 31 experience, which will be the basis of future September 1 filings.

**Project Status: Staff is presenting a summary of the accuracy of nine-month experience as a basis to project December 31 experience at the December 8, 2020 Actuarial Committee meeting (Item AC20-12-02).**

#### **F. Other Studies Indirectly Impacting Rate Level Projections**

1. Analysis of Very Large Claims. Given recent patterns of medical treatment and shifts in mortality estimates, including that for impaired individuals, it has been suggested that the WCIRB undertake a comprehensive analysis of the frequency and characteristics of very large or "jumbo" claims in the California workers' compensation system.

**Project Status: On August 31, 2020, the WCIRB in collaboration with rating bureaus in other jurisdictions published a national study on the basic demographics of "mega claims" (claims which exceed \$3M in incurred value on an on-level and trended basis). Staff anticipates continuing discussions with the other bureaus on a potential second phase of the study focusing on medical treatment patterns and individual claim development of mega claims and also plans to study the medical treatment patterns of larger (but with a different lower threshold) claims in California. While work on these analyses may begin in 2021, the studies are not anticipated to be completed before 2022.**

2. Frictional Costs in California. The cost of delivering benefits in California is much higher than in other states and a key factor that makes California a high cost state for workers' compensation.

**Project Status: Staff anticipates undertaking an in-depth analysis of these frictional costs to better understand the factors driving their exceptionally high levels with the final report published in the third quarter of 2021.**

3. Medicare "Set-Asides" (MSAs). At the July 28, 2015 meeting, the Claims Working Group recommended that consideration be given to conducting a more in-depth study of MSAs.

**Project Status: In 2016, the Claims Working Group and Actuarial Committee reviewed some initial work in this area which included the development differences between compromise and release settled claims and stipulated award settled claims. Staff does not anticipate further work on this issue in 2021.**

4. Impact of the Affordable Care Act (ACA) on Workers' Compensation Costs. The ACA has fundamentally altered the healthcare delivery system in the United States and may have significant impact on workers' compensation medical costs in California. At the October 1, 2013 meeting, the Medical Analytics Working Group discussed various ways to assess the ACA impact

on California workers' compensation costs in the future when sufficient post-ACA experience is available.

**Project Status:** The WCIRB published a report on the impact of the ACA on California workers' compensation in May 2018. The study results indicated that the increased availability of healthcare insurance through the ACA may be a factor in reducing the frequency of soft tissue claims in workers' compensation. Staff does not anticipate further work on this specific issue in 2021, but anticipates analyzing the potential impact of high deductible group health plans on workers' compensations claim costs for review of the Medical Analytics Working Group by the second quarter of 2021.

5. Analysis of Cumulative Trauma Claims. Recent Actuarial Committee analyses of claim frequency changes have indicated that cumulative trauma claims are increasing and are a significant factor driving many of the key cost trends in California.

**Project Status:** The WCIRB published a comprehensive report on cumulative trauma claims in October 2018. Some of the key metrics in the report have been updated and incorporated into the WCIRB's semi-annual review of system diagnostics. Staff also anticipates studying the patterns of medical treatment on cumulative trauma claims with a study to be published by the third quarter of 2021. Additionally, staff anticipates analyzing cumulative trauma claims as part of the comprehensive review of the WCIRB frequency model (item A1 above) to be presented to the Actuarial Committee in the fourth quarter of 2021.

6. Provider Treatment Pattern Analysis. In 2018, the WCIRB began to explore the impact of behavioral factors on the workers' compensation system. As part of that exploration, staff has entered into a partnership with a University of California, Berkeley behavioral scientist to study treatment patterns of various types of providers.

**Project Status:** Staff presented preliminary results on this study in the second quarter of 2019 and anticipates continuing research in this area in 2022 and beyond as available resources permit.

## **G. Studies Related to Rating Plans**

1. Experience Rating Eligibility. At the October 22, 2014 meeting, the Actuarial Research Working Group discussed changes to the experience rating eligibility criteria in light of other changes to the Plan being adopted and noted that staff has not completed a comprehensive review of experience rating eligibility in a number of years.

**Project Status:** Now that the changes to the experience rating formula to vary the split point by the size of the employer and the non-reporting of small medical-only claims have been implemented, staff is presenting a comprehensive analysis of the current eligibility threshold for review of the Actuarial Committee at the December 8, 2020 meeting (Item AC20-12-04) and the C & R Committee by the first quarter of 2021. Based upon the input of the two committees, staff will begin a comprehensive stakeholder outreach program in 2021.

2. Experience Rating Parameters. Until 2020, it had been several years since the parameters of the WCIRB's variable split Experience Rating Plan had been updated. In order to keep the Plan values current and to avoid wide fluctuations in values, the experience rating parameters should be updated at regular intervals.

**Project Status:** Staff completed an analysis of the Experience Rating Plan parameters with recommended changes approved by the Actuarial Committee at April 2, 2020 meeting for

**inclusion in the January 1, 2021 Regulatory Filing. As recommended in the analysis, staff will develop annual changes to the primary threshold intervals and D-ratio credibility constants in the Plan for inclusion in subsequent regulatory filings.**

3. Impact of Experience Rating on Workplace Safety. The statutory goal of experience rating in California is to incentivize a safe workplace. Although experience rating seems to create significant financial incentives and receives significant attention from many employers, there is limited research on its effectiveness as a safety incentive.

**Project Status: Staff anticipates completing a study on the impact of experience rating on the frequency of workplace injuries for presentation to the Actuarial Committee by the fourth quarter of 2021.**

4. Development of Experience Rating Expected Loss Rates. The Actuarial Committee annually reviews the WCIRB's methodology to compute the experience rating expected loss rates proposed to the CDI each year. The methodology used for this process was adopted by the Actuarial Committee at the June 11, 2008 meeting.

**Project Status: It has been a decade since a comprehensive review of the expected loss rate methodology has been undertaken. Staff anticipates undertaking a comprehensive analysis of the methodology in 2022.**

5. Retrospective Rating Plan Values. In 2018, the WCIRB completed a comprehensive update to the advisory *California Retrospective Rating Plan* values, including hazard group assignments, insurance charges and loss elimination ratios, to be effective January 1, 2019.

**Project Status: At the June 14, 2019 meeting, the Committee reviewed the paid loss simulation approach to loss development for purpose of computing retrospective rating values. Staff updated loss elimination ratios for purposes of classification ratemaking in the second quarter of 2020 and anticipates providing the update needed for the September 1, 2021 Regulatory Filing by the first quarter of 2021. Also, staff anticipates beginning the multi-year effort of updating the Retrospective Rating Plan values including implementation of a joint simulation of paid and incurred losses for loss development in 2022.**

#### **H. Other Potential Studies**

1. Analysis of California Regional Differences. Recent WCIRB analyses of claim frequency, cumulative injuries, liens, and other system components have suggested that there are significant regional differences across California.

**Project Status: Staff uses a wide range of available information to prepare analyses of regional differences in components such as frequency, severity and permanent disability patterns. The WCIRB's latest report on regional differences was published in November 2020. Staff anticipates continuing this work in 2021 with the annual update report to be published by the fourth quarter of 2021.**

2. Wage Data Analysis. Early in 2017, staff developed a comprehensive data cube and wage report for members with detailed information on various wage distributions by industry, classification and occupation as well as other wage related information. The information relates historical and projected wage levels by classification to industries, recognizing differences in payroll exclusions in developing insured exposures and differences in the allocation of standard exception classifications.

**Project Status:** Staff completed a comprehensive update to this wage information based on updated source information in November 2019 with an update provided to the Actuarial Committee at the December 5, 2019 meeting. Staff anticipates updating the components of this analysis needed for classification ratemaking in the first quarter of 2021 with a comprehensive update anticipated by the third quarter of 2021.

3. Comparison of Workers' Compensation Medical Costs to Group Health Costs. At the May 27, 2009 meeting, the Claims Working Group suggested that consideration be given to conducting a research study comparing occupational and non-occupational medical treatment cost data for a similar mix of injuries.

**Project Status:** Staff is recommending acquiring a dataset of group health transaction data to facilitate this type of research on potential cost shifting between systems and differences in treatment patterns between workers' compensation and group health.

4. Aging of the Work Force. This study would quantify the aging of the work force and identify changes in costs – particularly severities – due to this demographic shift. The study would also identify future aging patterns and forecast their impact.

**Project Status:** Staff completed some preliminary analysis of the impact of aging on claim costs as part of prior frequency studies, but does not anticipate conducting any further analysis in this area in 2021.

5. Terrorism Losses. In early 2003, the WCIRB contracted with EQECAT to help estimate potential terrorism losses with respect to the Terrorism Risk Insurance Act of 2002. The results of the analysis were published in a March 12, 2003 WCIRB Bulletin. In 2018, the WCIRB contracted with Risk Management Solutions (RMS), a leading catastrophe risk modeling firm, to conduct an analysis of potential statewide workers' compensation exposure arising from terrorism. The results of the study were presented to the Actuarial Committee at the December 5, 2018 meeting and published in January 2019.

**Project Status:** Staff does not anticipate further analysis of this issue in 2021.

6. Earthquake Losses. In July 2002, EQECAT completed a report estimating the average annual expected costs arising from California earthquakes. In 2003, EQECAT completed a follow-up study to address some of the issues raised by the CDI in reviewing the 2002 study. Based on the results of these studies, the WCIRB included a provision to reflect expected earthquake losses in the January 1, 2004 Pure Premium Rate Filing. In the Decision on that filing, the CDI rejected this provision based on concerns as to the underlying loss distribution projected by the model and the lack of a mechanism to fund the cost of a major earthquake if one were to occur. In 2007, the WCIRB contracted with EQECAT to update the California earthquake studies. The updated report was published in June 2007. In December 2017, the WCIRB in partnership with RMS published a further updated analysis on potential statewide workers' compensation exposure arising from earthquake.

**Project Status:** At the June 14, 2019 meeting, the Actuarial Committee discussed whether a pure premium rate adjustment to reflect the long-term average expected losses arising from earthquake based on the recent RMS study would be appropriate. Given the CDI's concerns in prior decisions and that including a long-term average provision for earthquake and terrorism exposure in advisory pure premium rates may create administrative issues for some insurers, the Committee agreed that the WCIRB's proposed advisory pure premium rates should not reflect a provision for earthquake and terrorism losses at this time. Several Committee members did suggest that published information

**on the potential statewide exposure of these events is of value and should be updated on a regular basis. Staff does not anticipate further analysis of this issue in 2021.**

7. Pandemic Losses. With the COVID-19 pandemic emerging in 2020 and generating more than 50,000 workers' compensation claims in California through October, the Actuarial Committee has discussed whether some analysis of the potential costs to the system of future pandemics might be appropriate.

**Project Status: Staff has begun discussions with a catastrophe modeler who has developed a pandemic model and are building out the workers' compensation component of the model. However, staff does not anticipate further analysis of this issue in 2021 but suggests that consideration be given as to whether a study in 2022 may be appropriate.**

8. Universal Healthcare Proposals. In 2017, the California Senate passed Senate Bill No. 563, which was intended to establish a government-run universal healthcare system in California. While this legislation did not address the funding issues and was never enacted into law, it is possible that the issue may arise again in California.

**Project Status: Staff does not anticipate analysis of this issue in 2021.**

## **Item AC20-12-08**

### **Potential Changes to Transactional Data Collection**

Since 2012, the WCIRB has collected detailed medical transaction information on a relatively contemporaneous basis. This information has been used in ratemaking and research and is used in several components of the pure premium rate filing. In 2017, the WCIRB began collecting detailed indemnity transaction information on a voluntary basis and began collecting this information as a mandatory data call in 2020. This year, both datasets have greatly enhanced our ability to understand the changes in claim reporting and development due to the COVID-19 pandemic and resulting economic downturn. For example, the new indemnity transaction data was used in the January 1, 2021 Pure Premium Rate Filing to help model relative exposure to COVID-19 by industry.

#### Eligibility Threshold

The current eligibility threshold for both data calls requires insurer groups (at the NAIC group level) that write at least 1% of the statewide written pure premium to submit data. Insurer groups are required to continue reporting even if their market share decreases below the 1% threshold. When the Medical Data Call began, insurers reporting represented 88% of the total market were required to report data and that share reached 94% in 2015. The market share has declined as market concentration has decreased and currently participating insurers represent 92% of the market. Groups representing 89% of the market are currently required to submit indemnity transaction data based on the 1% threshold. Given the growing reliance on the more contemporaneous and comprehensive transactional datasets in pure premium ratemaking, staff is recommending consideration be given to lowering the threshold for required reporting of both transaction data calls to 0.5%.

Staff solicited feedback from the six insurer groups who are currently projected to be required to submit medical transaction data if the threshold is lowered to 0.5% and received four responses. Staff also solicited feedback from the nine insurer groups who are currently projected to be required to submit the indemnity transaction data if the threshold is lowered to 0.5% and received six responses. None of the insurer groups responding expressed significant concerns with reporting transaction data in California given sufficient lead time. The longest suggested lead time for implementing such a change was 12 months.

Given the value of the additional information and the survey responses, staff proposes to lower the eligibility threshold to 0.5% for the medical transaction data effective January 1, 2022 and for the indemnity transaction data effective July 1, 2022. Based on the 2019 written pure premium market share, lowering the eligibility threshold to 0.5% would increase the share of the market reporting medical and indemnity transaction data to 96%.

#### Reporting Frequency

Insurer groups that report medical transaction data can elect to report on either a monthly or a quarterly basis. Insurer groups that report indemnity transaction data can elect to report on a daily, weekly or monthly basis. In both cases, the WCIRB Reporting Guides provide that all transaction data from a prior quarter must be submitted to the WCIRB by the end of the subsequent quarter. Given the importance of contemporaneous data, as highlighted recently in analyses of emerging COVID-19 claims trends and delays in medical treatment during the early weeks of the pandemic, staff is recommending that consideration be given to requiring monthly reporting of data with each month of transactions due to the WCIRB no later than two months from the end of the transaction month.

Currently, 30% of insurer groups participating in medical transaction data reporting, representing a 28% share of pure premium, submit on a monthly basis. Staff solicited feedback from five insurer data reporting groups and two third party data reporters who currently report medical transaction data on a

quarterly basis and received six responses. The responding parties all indicated that monthly reporting can be done, although two insurer respondents suggested that the time and cost in reporting infrastructure could be a concern with increasing the frequency of submissions. Responding insurer groups who rely on third party administrators to adjust claims did not have any special concerns.

Staff proposes modifying transaction data reporting requirements to require all insurer groups required to submit transaction data to submit no less frequently than on a monthly basis with the transactions occurring in a particular month due to the WCIRB no later than two months from the end of the month. To provide sufficient lead time to insurers groups, staff suggests that this change be effective for transactions beginning as of January 1, 2023.

**Item AC20-12-09**  
**2021 Schedule of Meetings**

The following is a proposed schedule of Actuarial Committee meetings for 2021. All 2021 Actuarial Committee meetings will be held by webinar teleconference. All meetings will begin at 9:00 AM (Pacific Time).

Tuesday, February 16, 2021

Tuesday, March 16, 2021

Thursday, April 15, 2021

Tuesday, June 22, 2021

Tuesday, September 14, 2021

Tuesday, December 7, 2021
